Look around more then, it is there.

ftp.demon.co.uk:/pub/atari/startup/stnet110.zip is correct IIRC.

It is suggested that you consider Expose once it is released as Apex Media
was originally designed to work with Expose. It is not released yet, but will
be available soon. Both Apex Media and Expose are/will (in the case of Expose)
be distributed by Lexicor Software Corp., if you have any more questions
about any of these specific product please feel free to
email to me or info@lexicor.com

Have a great new year!

I encountered a problem after the buffer/latch chip was changed in my
old ST. The original problem was complete inablility to use the MIDI ports,
the followup problem was completely ignoring the reset button. Have a look
at swapping the 74 series chip right by in the top left corner (the Maplin
catalogue will show a standard one and an open-collector one, if I remember
right. Take the open-collector one).

TE>at the time. With that being said....

TE>I just purchased Populous for my Atari 1040STe w/4MB and TOS 2.06 and
TE>the disk will not boot. On the otherhand, I plugged in my old Atari
TE>1040STf w/1MB and TOS 1.00 and it booted just fine. What is the
TE>problem and is there anyway to get Populous to boot and run on my
TE>1040STe system?

TE> Thanks,

TE> Theron

There are two versions of Populous. One works on the STE and the other
don't. The one that DOES comes in a compilation pack (a budget set) with
a couple of other games--I can't remember which. The standalone Populous
DOES NOT work on the STE and there's absolutely NOTHING you can do to
make it work.

RS>> A far better machine to get is a Acorn Risk PC, leaves all
>> other machines for

> Why are you still bothering us here?

RS > Yes to keep you all in check, and less of this drivel....

BWAHAHAHAHAHAHAHAH!

Roger, stop this. It's been apparent in the year that I've been wasting reading your highly negative and disinformative postings that you haven't got a CLUE about anything regarding Atari. And interestingly, when anybody goes and corrects you you mysteriously shut up and say nothing more about the subject you're pontificating on. Are you a secret agent for Microsoft, perhaps?

So WHO'S going on about drivel?

And before you use your well-worn accusation that I'm some useless layabout teenager on the dole that uses GFA Basic, let me assure you you're wrong - I turn 35 in February, I have a job (I've been at my current job for over seven years, and have been gainfully employed for ten), and I use an Atari STe system to do a lot of things - design signs for work, access CD-ROMs, write articles and critiques for the TAF club newsletter, PHOENIX, and develop small yet useful things for Atari users - mostly icons for Neodesk, though I'm now also branching out in developing some neat new .HYP files for ST Guide - my first being a .HYP of the ATARI GLOSSARY (with the cooperation of Howard Carson, the Glossary's author). Believe me, I've done a LOT on my "useless" Atari system that you've falsely claimed was impossible!

Tell me, what have you done other than carp, whine, and spread disinformation and abuse amongst us Atari users. I'd love to hear your answer (unless you decide to slink back into your hole and decline to answer me, you coward.)

... You're obviously suffering from delusions of ADEQUACY!

a.a. stands for atari.archive. as in the ftp site atari.archive.umich.edu.

By the way, that address is always busy, but a.a. is mirrored at many
sites (see the FTP FAQ posted monthly to this newsgroup) or can be
accessed by one of its other aliases, such as: msdos.archive.umich.edu
or amiga.archive.umich.edu.

10. YAC Shareware Programming Contest

Newsgroup: comp.sys.atari.st

From: szhays@dale.ucdavis.edu
Message-ID: <3e5vn5$48s@mark.ucdavis.edu>
Source record: 173756

YAC SHAREWARE PROGRAMMING CONTEST

Shareware Programmers: Would $50 help inspire you to finish that program you started over the summer but never finished? What if we could help you distribute your software to local BBS's, the major on-line services, the Internet, and at SAC Expo? We could also help you by writing and printing documentation to go with your program (we can translate from German to English if necessary). We'll even throw in a years membership to our local user-group: with its monthly newsletter mailed directly to you, and the honorary title of YAC Official Programmer for a year...

THE YOLO ATARI CLUB IS HAVING ITS ANNUAL SHAREWARE PROGRAMMING CONTEST.

Entries must be TOS programs new for 1995 and must be received by March 17th, 1995. They will be judged based on originality, compatibility (remember, there are all these new multi-tasking solutions and Falcon resolutions to try and respect), efficiency, and dependability.

Entry is simple, just mail your entry to the Yolo Atari Club at 1129 Fordham Drive / Davis, CA 95616 / USA. Or e-mail us an FTP-able location where your program resides (remember to include your program's name and the full path to it), although give us an extra week if you plan to do this so we can be sure to have time to download it. We can be reached at elhays@ucdavis.edu. Remember to give us a way to contact you. The winner will be notified by the end of March and then announced on-line and at the Sacramento Atari Computer Exposition, April 22nd, 1995.

Entry is free (or the cost of a single letter), and could earn you $50, fame, and glory. So why not give it a try?

RM> necessary in order to use one.

Hi Richard, I can help you with the Falcon info. The falcon has the zilog
SCC serial chip (the same one thats in my TT), it can do 2 Megabit in
synchronous mode. Its geared up for high speed serial stuff.
It will have no problem driving a 28.8K modem :-)

Cheers
Marcus

What hard disk s/w do you use?

ICD will do FAT marking from hdutil.prg I think, and ICD Cleanup will do FAT
or SCSI.

I've found I need to use SCSI from Cleanup for it to work though.

13. CD-Recorder on Falcon?

Newsgroup: comp.sys.atari.st
Date: 1995-01-01 15:40:50 UTC
From: lnonvei@public.srce.hr
Message-ID: <3e6ie2$4v8@nippur.irb.hr>
Source record: 173761

Does anyone have CD-Recorder?

Well, I want to upgrade a FALCON 030 because of sound capabilities he has.
But I am interested in recording CDs with CD ROM RECORDER/PLAYER. Is it
possible with Falcon? Are there any programmes to communicate with this
device? How much does it cost, and where to ask?
Wich CD Recorder is the best? I heared about Philips CDD 521 and Sony
CDW-900E about two years ago....
I also saw some adds about Audio master (Digital audio workstation - S/PDIF
Interface) for Falcon with coaxial in/out, optical in/out and port for
Falcon DSP. This interface is for DAT Recorder.
Is it of any use, 'cause Philips and Sony have SCSI-2 port, and this
interface doesn't (but Falcon has it).

Thanx in advance.

Unfortunately, Microsoft can't even properly implement their own
"standards"; there's no guarentee your RTF document will be loadable by
any Microsoft product.

Literally anything under NEXTSTEP will be able to handle it though,
probably without any loss of formatting. Strange, isn't it?

Agree. But you have to face the fact, that there is a very large number of
atari users out there, which hasn't got the need. Maybe not such a large
number as i think it is, but my statements are all based on experiences i've
had though the years i've been connected to all related atari networks in
europe.

HM> It is here.

Thats an surprise to me, but i will not disagree.

21. Mailing lists for Ataris

Newsgroup: comp.sys.atari.st
Date: 1995-01-01 22:29:40 UTC
From: bjb@bigbox.demon.co.uk
Message-ID: <788999380snz@bigbox.demon.co.uk>
Source record: 173785

Could someone tell me how to subscribe to the MiNT and Atari X-Windows mailing lists?
I have heard rumours of a public domain version of the AES, distributable in source or binary form in the same way as MiNT. I think it came from the MiNT mailing list somewhere. Has anyone else got any information on this?

Thanks

Lots of them are. Calamus is a _very_ powerful tool. And there is lots of
other highly professional software around. E. g. CHAGALL, DA's range of
products. Do not forget the music stuff!

>HM> Trying to be sarcastic? I think you have no idea about running a company and
>HM> making a living from it.

>One thing is for sure, you can not make a living based on atari equipment
>or software.

That's simply not true.

Many people make their living _working_ with Atari stuff (DTP, music), and
others do make their way _selling_ the hard & software. I doubt it is like
this in Denmark, but here it sure is.

And with the arrival of the new clones (T60, Eagle) and new alternative
operating systems (MagiCMac, Mag!C3) things are very likely to pick up around
here.

23. Dieter's .AVI player

Newsgroup: comp.sys.atari.st
Date: 1995-01-02 00:56:50 UTC
From: kim@dksoft.ping.dk
Message-ID: <FACAFFURUP@dksoft.ping.dk>
Source record: 173776

Has anyone of you tried this so called .AVI player yet ? If not, you
probably wont waste you time with it after reading this one.

I tested it tonight. This was suppose to be an .AVI player for all atari
machines, but for somehow it doesn't work on any of them 8-/

My experiences was:
1 out of about 20 .AVI files succeded in showing. The rest either had wrong
fileformat, or show some garbage on the screen insted.

Included with the player there was a program to rip out the audio in the
.AVI files and save it to another .WAV file. This program failed all tests
i ran. I never succeded ripping out a single _PROPER_ .WAV file. Either i
ended up with a 52byte file, which gave no sense at all, (i think this
happended if there was no audio included in the .AVI file, but i'm not
sure), or i got some 'normal' looking .WAV files, which just was
impossible to play without an error, (and an runtime error in ZeroX).

So this is how Dieter's .AVI player is running. And he'd release this as an
postcard-ware program. (how many wants to send him a postcard ?).

I think this is sad to see since Dieter has showen good programming before,
(GemView for an example). Maybe i've just been unlucky, cause included with
the program there is a .doc file, (in german language), where he says
something about different compression types. And i think he misses some of
them, which may be my problem here. But i'm not sure since i'm no good at
german language, so maybe someone would care to translate it.

Anyway, my point with this message is to show my dissapointment with his
program. I was really looking forward to try this program, and the result
was 1 single .AVI file, (without any sound), who didn't fail the show. If
the program only support one different type of compression, i can't really
understand the point in sending such a program out, since there seem to be
such a big difference in all the formats. I spend a few hours with this,
and i reached nowhere 8-(

Eventhough i had all this trouble, i still look forward to see improved
version's coming from him. So if there is anyone out there with some sort
of connection with him, you might want to tell him about my experiences.

> the main PCB.

Actually even at 48-50Mhz its as fast as a 32Mhz TT that has FASTRAM. At 33/40Mhz it lags behind (dhrystone tests naturally ;-)

> This results in an overall performance improvement. DMA gets way
> faster, and with a modified OverScan software you have really nice
> resolutions in _all_ modes. Even mid-rez becomes usable.

Does this allow you to have Overscan on a STE or MSTE? I must admit if the MSTE had been able to have Oversacn - then I probably wouldn't have been so tempted by TT-Hi.

> Did Vic publish the photos and other data he took in Hennef? I
> talked to him when he showed up at the MW-booth to compile some
> infos about the PAK and stuff. He seemed pretty amazed ;-)

Not sure - but I travelled up to a show in London to see a PAK3/33 in action. I was (and still am) very impressed. OTOH 2nd hand TTs provide *very* stiff competition for the PAK, especially when you take all the other TT features into account. Had I not been offered a 2nd hand TT which was exactly the spec I was looking for - then I would almost certianly have a PAK3 by now.

> Ok, TT-high is really nice. Thats one big advantage.

> better software ?

Some of use TOS/MiNT/MTOS users are not entirely happy with what MagiC will do at the moment. In my case this is really on the MiNT side. Now NVDI works with MiNT and has been around some time. MagiC is only getting there.

IMO when MagiC does everything for me that MiNT does (including MINIXFS.XFS and MiNT-NET support), *then* I'll be interested in it. From what I've heard it won't be too long before this happy state of affairs occur - but I'm not risking my money until then.

Roland.

Okay, here it is! The list off all of the ST STuff I have left over from years of using the ST/STe. Most have manuals but no guarantees. ALL are original disk - no copies! I also have 5 years of ST mags STart, Antic, ST format, etc which I will sell/trade in bulk only.

TRADE: I am looking for any cartridges for the 2600/5200/7800/Lynx & Jaguar If we do a trade I will split shipping. I would also be interested in any Macintosh stuff

PURCHASE: Make me an offer on all or part. You pay shipping. Leave e-mail with your offer and terms. I will do COD but you must add $8.50 COD fee.

Here is the list:

Hardware
Navarone Cartridge clock - has pass through & software
Plug & Play Hard Drive subsystem 20 MB Fixed and 5 MB removable with 100 carts

90 MB Hard drive & 30 MB hard drive in a combined system RLL ASK for details!

32. TOS14FX and HSMODA04 Problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-02 08:19:29 UTC
From: ewj8218@u.cc.utah.edu
Message-ID: <3e8cuh$96t@news.cc.utah.edu>
Source record: 173778

I recently upgraded my Mega ST to TOS 1.4, and I seem to have a problem getting HSMODA04 and TOS14FX to live happily together. They both kick each other out if another is already installed. If DRVIN.PRG and MFP.PRG run before TOS14FX2.PRG, the serial driver is not installed (and therefore RTS/CTS doesn't work properly.) If TOS14FX2.PRG runs before DRVIN.PRG and MFP.PRG, TOS14FX is not installed (and I encounter the TOS 1.4 .RSC file bug.) This is really frustrating. I could have sworn I read about this problem somewhere, but I can't find the info.

Any help would be greatly appreciated.

Ooops!

Well, I'll soon remove the 0927 version as well since the new interface
version is almost completely up and running now. There are a couple of new
functions, but most changes are in the interface code.
I expect to make a new beta of MGIF 4.4 available by the end of the week.

By the way, I've seen that quite a few people have fetched the 0927 version
and I would very much like to hear about what you like, dislike, miss, can't
understand etc. Please, email.

>using michtron.

The answer is yes, but a conditional yes. The only 9600 baud modem that he can use is the Courier HST 9600. And, his users must also have the same modem to connect. At the time that the MichTron BBS software came out, the HST was the standard and that's what was programmed to be accepted. There were no other 9600 modems at that time.

There is an upgrade in the works for the software. It was supposed to have been released around October/November, but hasn't yet. The upgrade is reported to have added better modem support (9600+) and better transfer protocols, among other enhancements. Personally, I'm waiting to get my hands on that upgrade as I run MBBS also! If I hear anything more about the upgrade, I'll post it.

Source record: 173787

Hey guys,
Recently I compressed a file on a PC using pkzip -& ,

which will span the zip file over many disks if it is too large

to fit on a single disk. But when I tried to unzip this on an atari,

using ST ZIP, the program didn't know what to do with it.

Any suggestions?

45. Atari Mega 4 ST for sale!

Newsgroup: comp.sys.atari.st
Date: 1995-01-02 17:38:13 UTC
From: jonaeson@algonet.se
Message-ID: <3e9dm5$295@aristotle.algonet.se>
Source record: 173792

Yes, I'm selling my good'ol Mega 4...
(Still keeping my STE and my F030)

It has the following spec's:

- Tower, lot's of room for internal harddisks etc.
- AdSpeed 16 MHz accelerator
- FPU, 16 MHz, works wonders for Calamus...
- Internal SCSI-interface
- 2 diskdrives
- Overscan (70% higher resolution)
- TOS 2.06 (Swedish, but can easily be re-burnt with any other language)
- Separate keyboard
- 4 mb memory
- battery backed up clock
- internal expansion slot
- Audio-connectors (balanced, filtered for optimum sound)

With it comes about 200 disks with various software, mods, and other stuff.
All necessary cables included, as well as joystick, mouse etc.

Price is 4000 Sek (1 USD approx 7-8 SEK). Buyer pays shipping.

Response by E-mail, or phone (Sweden) 08-745 21 41.

Regards, Tommy

There are many good PD and Commercial communication programs for Atari.
My opinion is that the best PD/Shareware is Connect 2.46 (you can find
it in almost any ftp site) and one of the best commerciall programms
is StalkerV3.

> I am getting a Roland Sound Canvas MIDI module for my Falcon very soon,
> and was wondering if anyone is aware of a PD MIDI sequencer, or at
> least a demo that I could play around with until I get the money
> together for a basic commercial package?

Hi Russ,

You should look for the Cosh Sequencer called Accompanist. It's here as
accomp25.tos but I don't know what it might be called around the FTP sites.

It certainly worked on a TOS 2.06 STE with a Roland Sound Canvas SC55 when
I first got it.

It's about 170k compressed btw

49. Problems with my 1040STE

Newsgroup: comp.sys.atari.st
Date: 1995-01-02 20:48:32 UTC
From: npetrlik@public.srce.hr
Message-ID: <3e9or0$fth@nippur.irb.hr>
Source record: 173798

Hi To All!

Weird things are happening to my STE. One day, whe I switched my STE on, all looks normal - booting, loading the program etc ... But, after 2 hours of work, the bombs appeared. Maybe some bug in the program, or some acc mess the memory ... i thought ... I simply pushed the reset button, and then (to be sure) <Ctrl>+<Alt>+<Right Shift>+<Del> for cold reset. Then, it happened again! (20, 30, and once 80 bombs !!). I switched the computer off for 30-40 seconds, then on ... and then ... no picture, nothing ... i panicked ... and switch him off for couple of hours. Next day, i worked 2-3 hours, and all worked normally (no bombs). As I mainly use a hard disc than a floppy, this "worked normally" is a very relative notion. I needed to format one floppy disc (I'm using FcopyPro and E-Copy). I've set the parameters (in FcopyPro) - nr of tracks: 80 (0-79), nr of sectors: 9. Fcopy starts to format a disc, 79,78,77,76,75... 31,30,29,28,27... and then the message appears: The Floppy Disc Head Has Reached Track 0! I repeated the formatting procedure, but it happens again on the other track. E-Copy do the same thing. (floppy head has reached track 0 ... etc). This 'reaching track 0' happening occasionally (usually after a 1-2 hours of work).
Friend of mine told me that MAYBE the MCU/GLUE chip have some 'bug'. I've look into the computer and discovered that MCU/GLUE chip is soldered (or glued)..
Where is the problem ?
Predator says that the disc drive is good (max. nr of tracks is 84 (00-83), max. step rate 2 ms).
Floppy drive type is Epson.
Also, when I'm scanning a perfectly good disc, Fcopy gives me an error message (on track>75, sometimes 77,78).. off course disc was formatted on this drive.
As I mentioned, this thing with floppy happening from time to time, and the 'bombing' happened 2 days ago (several times) - not program fault for sure ... it happening in every prg ..

Where might be the error ?

Many Thanks.

AJ,
For the ridiculously low price of something like $49.95, Dr. T's
KCS Omega is worth looking at. Feature-wise, it's competitive with
software costing ten times as much. It's very deep software, though --
you could spend years exploring every function. Of course, if you
don't need the bells & whistles, you can pretend they're not there.
Its graphic editing screen would be particularly helpful in cleaning
up tracks recorded with the guitar controller.

Bill

I think THE BEST PD word processor is Marcel. It is loaded with features
and can use the RTF (rich text format) standard so that you can exchange
files between Marcel and Word Perfect or MS Word on a Mac or PeeCee.

> also can anyone come up with a fancy signture file for me???

Nope. :)

You don't need the OverScan hardware when the PCB is running at a higher clock
rate. Only the software-part of it is needed to use the higher resolutions!

The common OverScan-hardware cannot be installed in "E"-models.

58. Does anyone out there use a Cannon BJ200e printer??

Newsgroup: comp.sys.atari.st
Date: 1995-01-02 23:39:07 UTC
From: stuart@cs.ualberta.ca
Message-ID: <3ea2qs$dap@scapa.cs.ualberta.ca>
Source record: 173703

Hi.. I'm looking for a good printer to buy for my falcon, especially since I have atari works, and I like to do a modicum of desktop publishing. I was recently recdommended a BJ-200 from cannon. I phoned Cannon of canada, and they informed me that the BJ-200 was discontinued, and that the BJ200e was still available- so now I am planning on getting a BJ200e. (I talked to someone else that said they were both discontinued, but I don't think he knows what he was talking about).

However.....

When I purchased atari works (and also, my falcon), there came with these products speedo Gdos.. after looking through the list of printer drivers, I see nothing for either the BJ200 or the BJ200e, which supposedly can run off the drivers of the BJ200. I do however have a printout from a BJ200e which states that it is compatable with the epson lq drivers (or it has an epson mode). This is good news since that covers most of the bases.

I do want to hear from someone though as to whether or not it is possible to either attain a BJ200/BJ200e driver for speedo, or if not, will the epson LQ driver do everything I want it to (which basically includes printing speedo bitstream fonts and perhaps the occasional black and white picture).

email would be appreciated, or else you can leave a message on this newsgroup, as I read it frequently.

Dave

On an ordinary 1040STE you can fit a Marpet XtraRAM+8 (which take a 4Mb machine to 12Mb). This fix is apparently no longer available for the MSTE.

Alternatively there is the PAK3 68030 upgarde for all STs and STEs (including MSTEs). This as well as as giving a massive speed boast allows the use of an extra RAM board. The PAK3 is not a cheap option though.

:-)

Roland.

Zip it and then uuencode it. Split the uuencode file up to put onto floppy
(with a text editor) and reassemble it on the Atari. The uudecode it and
then unzip it.

Should work anyway!

:-)

Sounds like a temperature related problem. You could try increasing the
ventalation to the case.

Alternatively a flakely PSU or socketed chip which has worked lose and
maybe loses contact when it heats up.

:-(

Christopher Taylor Oates (aspect@cats.ucsc.edu) wrote:

: 1) it's basic.

...And?

: 2) Do you need more than that? okay...

At the moment, all I've needed, in terms of external assembler subroutines, is a sample player. Everything else I've done is pure GFA.

: 3) anything that requires a runner program is lame. (i.e. Visual Basic)

GFA compiles. No runner program is required. (That's only for old 2.0 stuff) Version 3.0 and up have all had the compiler, and it works quite well.

: 4) I've never seen anything good done in GFA.

Fansi (my ANSI editor), Ms. Munchie (Robert Dytmier), Frantick (Dave Munsie), Bugs (Dave Munsie), Megapede (Dave Munsie), Kid Kong (Dave Munsie), Frogger (Munsie), Kaboom! (Munsie) and a ton more I could name if I sifted through my collection. Wait for my upcoming game, Mystic Tiles ... I'm sure that after seeing it you probably won'd hold the same opinion about Basic languages -- or at least GFA.

: 5) does it offer true, real, GEM support (I don't know)

You can either use GFA's questionable windows, or use real, honest-to-goodness GEM windows just like in any other language. One of GFA's strong points is that it lets you program at the level YOU want to program. It offers high level proprietary commands and routines as well as more complex low level routines -- right down to bitblt and LineA calls. And if you choose you can integrate C or Assembler code with it, too.

???

>3) anything that requires a runner program is lame. (i.e. Visual Basic)

You've never heard of the GFA-compilers, don't you?

>4) I've never seen anything good done in GFA.

Too bad. Perhaps you should take another look around. How do you know an
application is _not_ coded in GFA. There is a lot good GFA stuff ariund
lately. And a lot of sh*t as well.

But one cannot say GFA=bad or not good. It always depends on the programmer.
You can build a shitty app. with C, or Pascal, or whatever, as well.

>5) does it offer true, real, GEM support (I don't know)

With the proper libs it sure does.

>What's MagicNet?

As you may know, Mint provides an interface for external device drivers (.xdd) and filesystems (.xfs). The xdd drivers in MintNet are used to provide network connections to any GEMDOS applications using simple GEMDOS (well, Mint) calls.

MagiC 3 also provides an interface for external device drivers ad filesystems. It is different (sigh) to the Mint interface (although there are reasonable arguments for the differences). But the author of MintNet (Kay Roemer) appears keen to rewrite his Mint xdd drivers for MagiC (and hence call it MagiCNet), thus providing an identical service for GEMDOS applications.

This is somewhat dependent on the MagiC team providing detailed technical documentation to Kay, but we have our fingers crossed!

Did you know that the developers of SpeedoGDOS 5 have an interface prepared for Calamus fonts (.CFN?), so perhaps a Speedo 6 may include a CFN engine?

AFAICS, Calamus breaks the TOS programming rules all over the shop, which is why it doesn't work well with *any* multitasking TOS, MultiTOS included. How actively is DMC updating Calamus nowadays? Can they be persuaded to fix it for multitasking TOSes?

Hello,

i want to buy a HP Deskjet printer 520 or 500C. The problem is, that I don't
know if my Latex-Driver will work with this printer.
So i'd like to know if anyone has experiences with the multi-tex system,
implemented by C. Strunk on an Atari St and a Hp-deskjet printer.
The driver in multitex is named dvi_dot.ttp.

Any information would be great ...

Thanks Rainer

Source record: 173731

Dave - I have used a Canon BJ200 quite happily with Atari Works, Speedo GDOS, Pagestream 2.2 etc for a year or more.

I use the Canon BJ10 driver from Speedo which gives excellent results and no probs to date.

The Epson LQ emulation works fine too (easily changed if desired as at least the DIP switches are readily accessible).

If you are using a non-graphical word processor and relying on internal printer fonts use LQ emulation - there are more fonts to choose from.

: >anyone to work with 9600bps modems?
: >
: >a local bbs would like to get 9600 baud working and still keep
: >using michtron.
:
: The answer is yes, but a conditional yes. The only 9600 baud modem
: that he can use is the Courier HST 9600. And, his users must also have
: the same modem to connect. At the time that the MichTron BBS software
: came out, the HST was the standard and that's what was programmed to be
: accepted. There were no other 9600 modems at that time.
:
: There is an upgrade in the works for the software. It was supposed to
: have been released around October/November, but hasn't yet. The upgrade
: is reported to have added better modem support (9600+) and better
: transfer protocols, among other enhancements. Personally, I'm waiting
: to get my hands on that upgrade as I run MBBS also! If I hear anything
: more about the upgrade, I'll post it.

Michtron will quite happily accept any 9600 modem, although you have to
switch off any compression. (Connect 9600/V32/NONE)

Any attempts at higher speed will fail.

In sweden there was quite a few boards that ran a hacked version that
could accept 14.400, but it had a few bugs, and didn't work very reliably.

Since Michtron isn't really programmed to handle higher speeds than 2400
the throughput doesn't improve very much. around 460 cps in 9600 compared
to around 230 cps in 2400.

Regards, Tommy

88. Old Atari Disks, Fixing

Newsgroup: comp.sys.atari.st

From: ai066@FreeNet.Carleton.CA
Message-ID: <D1u7Ax.KKI@freenet.carleton.ca>
Source record: 173739

I recently acquired a large collection of old disks for My Atari. I want to know what the best wa otysensure their longevity is. This is what I was considering, for the non copy-protected disks:

Running them through Diamond Edge's Read-Write Read Bad sector mapping. My logic for this is that it would help to take the data already on the disk and rewrite it, so that the disks would be less likely to loose their magnetic info. Is this a good/bad/indifferent idea? I am also running them all through UVK, and have already caught one instance of the Signum virus.

Thanks!

Mac has the same problem, however F030 is quite new product so the
applications for it are new too. Then what would be a problem to
recompile it to PPC?!?

> 2) ST-compatible video (ie, like the ST, STe, TT, Falcon) would slow

> those annoying programs that try to hit the video directly

Its not a problem at all. Almost all new stuff on F030 uses video
correctly becouse of some new modes so there could be brand new modes
with the old ones for compatibility like on F030.

> 3) Linux would be the only native PowerPC software available; there are

Amen to that! Just TRY to make a living developing software for the Atari. It's never been easy but now it's nearly impossible, IMHO. I applaud those that are still hanging in there out of love for the machine, certainly NOT due to some misguided profit motive. ;-)

>5) does it offer true, real, GEM support (I don't know)

Oh, come on, Christopher. I expect this kind of drivel from SOME people on the net, but not you.

Claiming that any programming language is garbage because it is BASIC (or Pascal, or Cobol, etc) is nonsensical. Likewise, claiming that any program written in that language must also be garbage is just plain dumb. Just because YOU have never seen anything good written in a given language does not mean that nothing good exists.

In regards to GFA, you imply its lame, but you obviously know little about it, e.g, it compiles into a fast, standalone executable (unlike VB) and it -does- provide for all GEM calls. You would likely be surprised to see just how many commercial apps were written in GFA. It's a common practice not to advertise the fact, due to narrow mindsets as yours.

I have used GFA extensively on the Atari as well as DOS and Windows, but I have also used a score of other languages (C, Lisp, Fortran, Pascal, Modula 2, et al) on other platforms. I will be the first to admit that GFA has some serious flaws (particularly in memory management), but it has some superb features as yet unmatched by other languages, too. I would not turn to GFA for all projects, but it will still be considered. Dave Small, Charles Johnson and John Eidsvoog are three of the best assembly and C programmers I've ever known, but each will tell you their are times when BASIC makes more sense and they will use it as needed.

Bottom line... I don't care WHAT language a program is written in as long as it does what it claims, does it well, and meets my needs. And I think you will find that is the predominant opinion among mature, thinking users.

Now if you want to flame Microsloth's Visual Basic product, I'm right with you... that IS a fine piece of junk! Er... IMHO, of course. :)

Dear God, is this still in the works? Back in March 1993 when we ran
MBBS on Ad.Lib it was "in the works" then too, with the same promises
:-> We would have never switched software if this had come off, and if
promised fido mailer support had happened.

Back in the mists of time when I moved from an STFM to an STe, I had to
sell my copy of Populous and buy a double-pack from Infogrames which
also contained Sim City. This version works fine on the STe.

Hi !

My friend have an STE with 1MB,
and one day his STE recognised only 1/2 MB.
The diagnose was that the other 1/2 MB
(two 256K SIMMs) are burned..
What is the cause of that ?
Is this because of overheating, is
the transformer board bad ?
Any other possibilities ?

And one more question: Is it possible
to put PC SIMMs into 1040STE, and how ?

Thanx.

96. Marpet Xtra RAM or PAK3

Help, please. I have a dead 520ST with TOS 1.4 and a 1 meg upgrade. I also have a 520STfm with TOS 1 and the original 500K memory.

Does TOS 1.4 require the presence of 1 meg? The reson I ask is that I tried to shift the six chips (U2 through U7) over from the St to the STfm and all I got was bombs. I was very careful to orient the dots on the chips with the drawings on the motherboard. Do I need to exchange U1 as well? what is U1 anyway? Is it the system ROM?

I also would like to shift one bank of DRAM's over to the STfm. Someone just posted a note that the STfm has the extra slots for the second bank of RAM, but was not sure of the value of the resistors taht need to be put into the remaining slots.

I would much appreciate any help with these problems so I could have a fully functional 1meg ST with TOS 1.4.

Thanks a bunch and have a happy new year!

It produces crappy programs that crash under many Atari compatible OSes
(MagicMac, MultiTOS, etc.).

One might see this a one big advantage of Calamus.

You're able to connect the high-end printing hardware directly to the Atari
without fiddling woth RIP's and stuff.

IMO PS isn't all that great at all. All sorts of difficulties are likely to
occure when you try to use a document on another system or even another
machine. E. g. kerning problems due to missing fonts or different set-up's.

>they be persuaded to fix it for multitasking TOSes?

The latest 94-Update was a re-port from the WinDoze-NT version. Most peolpe
consider it being _very_ buggy and rather use an older version.

Atari-Calamus itself won't have great support from DMC any longer, I believe.
However, the guys from Adequate Systems are doing some great modules lately.
There's even a replacemet for the PKS-editor coming RSN. AFAIK, its name is
"Eddie".

] What is the cause of that ?

Open up the machine, remove all the SIMMs (Carefully!), and then
put them back in in a different order. With any luck, they'll start
working again. (The standard sockets are pretty terrible, I've got 2
STes which have given me SIMM trouble, I've had one lot replace, and
the other one has them held in place with duct tape! (NOT Duck tape :)
Hey, it may be a pretty stupid method, but it's cheap, and it works!#

I switched PSU's between my 2 STEs because my good machine (last
revision, with 2.5meg), was playing up, (crashing a lot, making nasty
noises etc.) And the problems went away, it now only seems to crash
when I first boot it up! (It seems that the chips like to warm up before
they work properly :)

MagicMAC enables you to run a lot of your Atari ST software on
the MAC, in many ways it is similar to SoftWindows or SoftPC.
It only consists of software , i.e. it is a port of the MagiC OS
(real multitasking for STs) to the 68k Mac Platform.
MagicMac works parallel to your other Mac applications.

I don't want to post too long of a plug here; I've just been using
the beta test version for 4 weeks now, but it is really great fun to see
how fast the ST programs run on my Apple Performa 630, they fly.

I do not know whether the company that does MagiCMac markets their
software outside of Germany, AFA I know they don't have email, but
you can try to reach them at:

Application Systems Heidelberg,
Postfach 102646, 69016 Heidelberg, Germany (snail mail)
phone : (int. access code) 49-6221-300-002
Fax: 49-6221-300-389 (probably best way to go).

> If anyone is using this,I need to know how it works with midi suff.
I'm not using MIDI, and Macs usually do not come with that kind of
interface, so you need to ask the developers.

> All help will be geatly appreciated,and all messages will be answered.

you can reach me at goetzn@pop.gun.de, or maybe drop me a line at
49-2102-843-282 ,if the line is busy, I'm probably surfing the net ;-)

Try using a cassette or tape-deck head demagnetizer (the ones with a power
cord attached, not the battery powered cassette types), move it in circles
on front of the dis-colored spot on the screen and slowly move away from it
(keep circling). This might do the trick.
If this fails too, take your monitor to a TV repairshop and ask if they can
demagnetize it (they normally have a much more powerful demagnetizing
coil), it should take no more than a few minutes.

>recompile it to PPC?!?

Because the PPC is an *entirely* _different_ cpu. If it were that easy as you
naively believe, why are so little applications available as PPC-native
binary? 68k's and PPC's are not binary compatible. A simple re-compilation
wouldn't be enough.

The 68k-series used in MAC's and Atari's are compatible on the cpu-part. The
difference is in the hardware (bus, video, sound) around it. These differences
can be worked around, using OS-calls properly.

>> 3) Linux would be the only native PowerPC software available; there are

>
>The answer is the same as for 1)

From what I've heard, the folx doing the Linux-PPC port do have all sorts of
problems. This version is far from running. And Linux 68k-binaries are not
compatible to PPC-Linux as well.

There have been a number of rumored release dates for an upgrade. It hasn't been a MichTron product since the company was sold, a few years ago.

As to hearing from the author directly (yes, Tim Purves), I have. He was a guest of the BBS RT a few months ago on GEnie, talking about the upgrade. He was hoping to have it out in October/November. Obviously, it's not out yet. There are a number of us waiting to hear more definite plans.

Well Marpet are on:

marpet@cix.compulink.co.uk

A UK dealer that has the PAK3 is System Solutions:

ssolutions@cix.compulink.co.uk

You may well find that TOAD does both products and they might be easier
to deal with for you.

> the STfm and all I got was bombs. I was very careful to orient the
> dots on the chips with the drawings on the motherboard. Do I need
> to exchange U1 as well? what is U1 anyway? Is it the system ROM?

I swapped TOS 1.0 for TOS 1.4 in an old STM. All I did was remove the 6 original ROM chips and put in the new TOS 1.4 ones. I didn't need to move any jumpers or anything. It only gets messy if you swapping a 2 chip TOS set for a 6 chip TOS set - or vica versa. In this case a jumper has to be move/resoldered.

I don't know what U1 is - but AFAIK all the ROM code is in the main 6 chips. There is nothing else that is used.

:-)

Roland.

I'm not that knowledgeable about modems. How would I turn off the compression on a Supra v42bis 14.4 FaxModem, for example? It was my understanding, from the author actually, that the HST Courier was the only modem able to work with MichTron BBS. If it's possible, even limited to 9600 baud and ~500cps, it would be better than a 2400 limitation. Details, man, details!! <g>

128. ICD Boot Delay Removed...

Newsgroup: comp.sys.atari.st
Date: 1995-01-04 01:24:27 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3ectcb$jk1@golem.wcc.govt.nz>
Source record: 173607
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well now I have found the delay fix...

To get rid of the 3 second ICD boot delay with ICD booter 6.5.5.
set this veriable to a small number..

Make a copy of the ICDBOOT.SYS file, and have a look
at bytes at offset B4-B5 ie, at the start of the file, they are 02 58,
this is = to 3 seconds, they use the 200hz system counter, change this
to say 00 01 will give you no delay, don't put a 00 00 as this could cause
problems and very long delays, as the counter could have just ticked over,
and there is no checking for this...

For 1/2 second delay use 00 64, a count of one = .005 seconds....

This feature is not in the 6.2.0 version of the booter, but there is a patch
program to fix that called ICD_PSU....

ICD Booter 6.5.5. is I think the current version....

I've never used Captains QWK, so I won't judge it, but the operative word,
I believe, was Bluewave...as far as I'm aware, Mountain Reader II is the only
ST offline reader that handles it. Of course, the plug can be carried even
farther with the quality of the program itself, which is top-notch, as well
as with the service given by the author, which is always within 24 hours
of instantaneous.

Except that every version that I have tried of it, bombs frequently on
my machine at least.

My recomendation is to use IMHO or try the newest one out KiviQWK which
so far seems quite okay.

Cheers,
John

Okay fine... I programmed for basic for many years before discovering C.
I can never go back. Anything with the word "Basic" in it makes me cringe.
I cannot think of one thing that could be done better in basic than in C, or
C++ (which I'm currently learning) Perhaps I've simply not looked at
"mopdern" basic packages, so if they offer all the useful stuff (inline
assembly, real function calls, true structures, etc.) then what do you have?

I'll tell you - It's C with differnet syntax, so why not just use C?

From: as475@cleveland.Freenet.Edu
Message-ID: <3edb37$dq4@usenet.INS.CWRU.Edu>
Source record: 173670

Greetings all!
Happy New Year!
I am looking to jump from my 1040stf to something quite bigger but am weary of going IBM. I like a lot of the nics and nacs of Atari's. I was wondering if anyone had any substantial info on the Falcon...Like how easy is it to upgrade to 040? Do they have any new plug-in boards other than the 286 one (ie. 386 or even 486 like the flyer says!)? I have also heard a few blips about Medusa...What exactly is it and does anyone have any solid info on it. Like is it for sale to the States? or does FCC have shit about it like they did for so long with the STe? If anyone can help me out with this I would really appreciate it. Also if anyone can tell me more about the TT...I don't have any info on the TT...well real info anyhow.

Thanks much!
_J.Starr

[problem desc deleted]

The first part of the problem (the bombs for no apparent reason)
MAY be defective SIMMs. I had problems kinda like the ones you
described when I bought my 1040STE new and it turned out to be a
defective SIMM (or a few!).

>performance, if any? and who wrote/endorses its use?

Speedometer is the most widely used Macintosh performance test utility (much like Ofir's GEMBench tool) and has been around for many years. It's now in it's version 4.0 incarnation and supports PPC as well as 68K based machines. The author, Scott Berfield, can be reached at sberfield@aol.com. MacBench (Ziff-Davis) and MacTest (Apple) are two other similar utilities, but not as widely used.

Speedometer includes 4 categories of tests... Performance Rating (PR), Benchmark Mix, FPU Benchmarks & Color Quickdraw. The PR tests conduct a series of tests for cpu, graphics, disk and math. The raw results are reported and then normalized to a 'PR' number for comparison with a given base machine. The utility incorporates graphs and machine records so that one can easily compare, graphically, the performance of any tested system with several other machines. It's very well done.

In a previous article, aspect@cats.ucsc.edu (Christopher Taylor Oates) wrote:

>Okay fine... I programmed for basic for many years before discovering C.
>I can never go back. Anything with the word "Basic" in it makes me cringe.

Hahahahaha... I just KNEW that you were a C programmer, Chris! I don't know why, but from my experience, C programmers as a group are the most defensive of their 'chosen' language. Freud would call it insecurity but I think it's just bull-headedness. I use C too, but it ain't a RELIGION to me. :)

>I cannot think of one thing that could be done better in basic than in C, or
>C++ (which I'm currently learning)

I can't either, but that's not the point.

>Perhaps I've simply not looked at "mopdern" basic packages,

Yeh, you are probably still thinking of old line-numbered BASICs that were interpreted only, hideously slow, had global vars only, single dimension arrays, no dynamic structures, and relied on GOTOs to do anything at all. :) The newer, 'third-generation' BASICs are much more 'C-like' in structure, capability and performance, while retaining the original ease of use.

>so if they offer all the useful stuff (inline assembly, real function
>calls, true structures, etc.) then what do you have?
>
>I'll tell you - It's C with differnet syntax, so why not just use C?

Actually, it's more like a macro-assembler with a high-level front end, but that's beside the point. People often turn to BASIC because they find it's high-level syntax to be much more English-like and easier to learn. They then discover program development and debugging time to be much shorter than C or other comparable languages.

An interpreted environment is ideal for program development as it allows incremental buildup and testing without the long code-link-compile-test cycle typical of lower-level languages. Once the programmer is satisfied with the codes operation, it can then be compiled (just once!) for max performance. The question logically becomes, "why not just use BASIC?"

Because... C (and C++) still offer many considerable advantages for large scale program development... flexibility, portability, compactness, modularity and speed come to mind as key features (there are others). And becoming a BASIC guru is typically not as career enhancing as if you dedicated your time to C/C++, of course. :)

Point is, there ain't no such thing as the perfect programming language. As Hendrik pointed out, one can write a garbage program in C just as

easily as in BASIC (I've done my share!). The 'art' is in how the -programmer- incorporates his ideas into a working piece of code and for me, I can appreciate that no matter -what- language was used!

But like the man said, 'Your mileage may differ.'

Cheers,

-Hutch- @ Fair Dinkum Tech

I've got TOS 2.06 on my STE, but I was wondering if it would be possible to make a customized version of it, not commercially (copyright), but privately?

The reason I ask is because of the errors and bugs that there are so many patches for, and it would be nice to just have it all fixed up in ROM. Also, it would be nice to have the keyclick default to off, so I would have to go to the control panel to turn it on (opposite of now).

I don't have a n EPROM programmer and I don't know how, but has anyone done anything like this before?

Hallvard

>>CompuServe account 100067.3712@COMPUSERVE.COM

>I'm not using MIDI, and Macs usually do not come with that kind of
>interface, so you need to ask the developers.

[FAQ on]

Q: What about the DMA interface and the ROM port?
A: Macintosh computers are not equipped with a DMA interface or a ROM port.
Therefore you cannot use an application which needs the DMA interface or
ROM port for a protection key (dongle). The Atari laser printer cannot be
used with the Mac. Several companies intend to develop a card for the Mac
which will allow DMA and Midi.

Q: What about Midi?
A: The midi interface is optional. At the moment it is not supported
by MagiCMac

Has anyone had any luck getting this to run on an STE? (This one is 2.5meg). I can _sometimes_ get the title screen to appear (well, title screens as it's almost 4 screens large), and occassionally the startup sample (an air-raid siren which is half the archive size), will play, but then the computer either crashes completely, or shows 2 bombs and quits back to the desktop whereupon things cease to function properly. I'm running it from my hard-drive, but I tried it from floppy with no TSR's etc. and got the same effect.

Why is it always the large files that take ages to download that never work properly!? :)

>
>I'll tell you - It's C with differnet syntax, so why not just use C?

It all depends how much time you would like to spend in learning a
'difficult' language like C. I also programmed many years in GFA Basic and
it's stiil my favourite Basic on the ST/STE/TT/Falcon, it's just too bad it
doesn't run with MultiTOS. The Basic is fast (very fast) very easy to use
(editor and instructions) very powerful, quite crash resistant (unlike C)
I still use it now and then (just switch of MT, make a program and switch
back on MT...) for those 'quick and dirty' converter utils.
Nothing can compare to that, I also program a little in C but the whole
'pointer-to-pointer-to-an-array-of-pointers' stuff just gives me the
creeps. It's much (and I mean much) easier to set up a few arrays, put in
some inline code, peek and poke around a little, do some nifty string
manipulation etc.etc, in Basic than it is in C. No offense, I have to go C
programming on my newly aquired Linux setup so maybe in a few months I'll
be raving about C too, but so far I think C is just clumsy: slow in compiling,
no 'direct' mode, no easy to handle graphics stuff. If you want to write
some stuff fast, go for GFA, if you want to program stuff for the world, go
for C (but then get Unix too, so everyone can use it :-))
I just hate when a program crashes awfully just because I forgot a '&' sign
in an input function, raaahhhh. (yeah I know it's 'legal' to put the
response value into the pointer's address but alas...

One member of our computer club here has started programming in Visual
Basic (just a couple of months ago!!) on the PC without prior programming
or computer knowledge, he showed a few programs (for Midi use) and I was
astonished by the quality (and even by the speed) of the creations. It just
all depends how you have learned to program, I for myself have started on a
Z80 (MultiTech Microprofessor) back at school and still like programming in
assembler (on all sorts of CPU's exept the segmented 80x86 stuff), they
should do that more often instead of just buying faster processors :-)

It's just a matter of taste I guess, just as we are still using Atari's !
But we shouldn't condemn something just because we don't know it or use it.

Why else did they make a PC version of GFA Basic (and a good one too...)

Gert

BTW, who knows what tiny tool was written in? ;-)

The one main problem with GFA Basic is (was?) that it doesn't use memory correctly, and anything written in it tends to crash MiNT and other multitasking systems. But HiSoft Basic is a good alternative if you are considering upgrading.

Arrghhhhhh! Not again ;-)
If you mean for SLIP or PPP connections... yes. But none of them are GEM
based (yet). If you have the memory and harddisk space, I'd recommend MiNTnet.
It is a UNIX like package, but you need to know Unix fairly well or be good
at figuring things out.

159. MicroVitec Cub 895 on an ST?

Newsgroup: comp.sys.atari.st
Date: 1995-01-04 19:51:39 UTC
From: tjl@siva.bris.ac.uk
Message-ID: <D1wCI3.Dzr@info.bris.ac.uk>
Source record: 173609
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Greetings, and happy new year.

We're clearing out our lab at present. We've had a MicroVitec Cub 895 colour monitor knocking around for years (it was bought for use with a VME graphics card years ago). Unfortunately the manual has gone awol. I'd like to know if its possible to get this monitor to work, either in medium of hi-res, on my STFM. It has what looks like a standard PC graphics connector (9-pin D-type).

Is anyone using one of these on an ST? Any harm in trying to connect it to my Ladbroke ST-VGA convertor box?

Cheers, e-mail or a CC when following up would be appreciated.

I am fortunate enough to have gotten a 14Mb Atari Falcon (one of the early development machines) for very little money. Now, rather than selling it and making vast amounts of profit, I am considering keeping it.

I use my Amiga A4000 (boo hiss!) to produce graphics for Raves.
What uses could I put the Falcon to?

Can it produce a full Video Overscan picture? (736*566 or better)
In how many colours?

Is there a program that will take the sound output from the DJ into the Mic socket and produce pretty graphics in time with (or derived from using complex maths) the sounds? Sort of Colourspace Plus?

Are there any programs that do nice psychadelic imagery?

Are there any nice fractal programs?

Anything else you can think of that might be of use?

Well all this raving about fast 28.8 modems and all this name calling,
it seems if you don't have any facts to back up your statements you end up name
calling or pick on ones bad spelling, what is wrong will all you Usenet readers,
don't you have a life, ? or are you just STOS using teenagers, or is it you are
just frustrated Atari users and just wish to take your frustration out on me.??

Them may be you do need a better computer...!!!

Here in NZ the phone lines are rated up to 9600, if you can run faster then you
are in luck, if you don't believe this go ring Telecom here...

Most of the low end Modems don't like poor lines, ie, the ones with Rockwell
chips in them, but could be OK for a BBS that is only a few miles away, try
using them to out side NZ that is where the problems start....

One of the Best low end modems is the ZyXel, but here in NZ they cost twice
as much as the otheres....

I even have problems in calling a site in Germany, never ever got a 14.4
connection, and at 4800 would drop me off after a few minutes..

Also you will find most firms making V34 28.8 modems are having problems with
them, so it will pay to wait till all the bugs are removed, FACTS...

So if you don't wish to listen to your elders that is your problem, but then
again that is a Teenager thing, is it not...

P.S. I have never ever stated that Teenager use GFA, I think it would be more
like STOS don't you think...:-)

Sure. Done it myself.

>The reason I ask is because of the errors and bugs that there are so
>many patches for, and it would be nice to just have it all fixed up
>in ROM. Also, it would be nice to have the keyclick default to off,

That's exactly the reason why I did it. All patches applied, WinX added, and
some other fancy stuff.

I've done all my patches with TOSPATCH. The filename is s. th. like

TP206V38.*

where the 206 indicates the version for TOS 2.06 and version 3.8 of the
pachfiles itself. A TP306***.* is available as well and brand new TP404V10.*
for the Falcon.

The big problem with the Falcon-patches are the 16-bit-wide Eproms. I only
know few prommers capable of handling 16-bitters. Some adaptors are available
to use those Eproms with some more commonly used programmers, though.

>I don't have a n EPROM programmer and I don't know how, but has
>anyone done anything like this before?

Well, not having an Eprommer is a problem. But perhaps a friend has one, or
knows s. o. ...

I installed 2 27C020 (2Mbit) Eproms in my MegaSTE. With the flip of a switch I
can change my OS ;-)) Even Mag!C can be put into Eproms nowadays.

S > WOrd Pro???

There are two out there that are really good - one is dBWriter
by David Becker, the other is Marcel (actually, it's shareware but
really affordable at $10.00 US). Marcel offers a number of options
including the ability to save in RTF format as well as to import a
number of different text formats.

Don't worry, Eric, I have NOTHING against GFA Basic - but for some reason Roger Sheppard (who the original post was sent to) has some sort of hostile bias against it, and has on occasion called people who've used it "idiots". He also has a habit of accusing people who disagree with him "obviously another useless teenager". I was just covering all my bases with that reply :)

R > very soon, and was wondering if anyone is aware of a PD MIDI
R > sequencer, or at least a demo that I could play around with
R > until I get the money together for a basic commercial package?

There are a few of them that I'm aware of - there's the Cosh Sequencer, there's also Alchemie Jr. Both have been highly recommended by a number of people I've heard/read from regarding ease of use - but in my case they never really worked out, probably due to the way I like to work (which is why I use E-Magic's Logic now). And I'm not sure if either will work on a Falcon.

You could see about getting the back issue of ST FORMAT that had the giveaway of the original version of Dr. T's KCS OMEGA on the front cover - it's supposed to work on a Falcon AND it's supposed to be quite powerful. It's on issue #54.

When you do go for the basic MIDI package, I'd recommend E-Magic's Notator 3.02 - it's easy to get to grips with, and is VERY powerful.

Oh, and have fun with your Sound Canvas when you get it - it's a pretty impressive piece of kit right out of the box - and when you find the parameters and start twiddling with them, you'll find it's even more powerful.

171. 9-Lives

Newsgroup: comp.sys.atari.st
Date: 1995-01-05 00:30:29 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3efej5$5do@golem.wcc.govt.nz>
Source record: 173601

Here's an old one, who remembers the old ST game "9-Lives". It was one of the programs thought to be PD and then claimed back by Atari who told everyone that it (among others) wasn't PD. (Including Neochrome, Disk Doctor and various others). I've got a copy of 9-lives, but I'm not sure if it's a demo (was there one?) or the full thing. It seems to be quite an amusing little game, but if it _is_ the full thing, then I can't work out how to get out of the current area. The file is packed with Ice v1.1 and depacks to 298880 bytes which seems like it could _possibly_ be the full thing, as I can see the other areas behind the walls etc. but can't get to them. Anyone know if this is the full thing or not, and if so, how do I get to the other sections?

AFAIK this game was only ever released in a compilation type format with the computers, and is virtually impossible to obtain any other way since Atari hid it from everyone.

Btw - Any coders out there, convert "Club Drive" to the ST, after seeing Star-Glider 2, I won't believe that the ST isn't capable of it! (minus things like the fractal fire-place & texturemapped bits). This game is _brilliant_! (Okay, obviously it can't be ported as it's commercial, but something similar should be possible :)

>Mac has the same problem, however F030 is quite new product so the
>applications for it are new too. Then what would be a problem to
>recompile it to PPC?!?

Because the PPC is an *entirely* _different_ cpu. If it were that easy as you
naively believe, why are so little applications available as PPC-native
binary? 68k's and PPC's are not binary compatible. A simple re-compilation
wouldn't be enough.

In theory, you are wrong. A recompile should be the only thing required.
In practice, you are correct. Mostly this is due to developers doing
clever things that violate good programming rules and to the OS provider
for making incompatiblities in the "toolbox" library support.

If you gave me a GEM/AES/BIOS etc. set of libraries and a PPC Atari, I
should be able to recompile with a PPC compiler and run Atari code.
In theory :-)

Several years past I routinely wrote code that compiled and executed
unchanged on VAX, SUN, IBM, and AT&T 3B machines. It is possible.

I assume that the reason it takes time to get PPC native software out
is logistical. Buy a machine, learn a new compiler, establish another
development environment, test, test, test, test, test...

In an article by the the infamous sheppard_r@ix.wcc.govt.nz (Roger Sheppard.) he writes:

> Well all this raving about fast 28.8 modems and all this name calling,
> it seems if you don't have any facts to back up your statements you end
> up name calling or pick on ones bad spelling,

I`m VERY VERY curious on what facts you base YOUR statements about
the global usefullness, or lack thereof, for 28k8-modems. Are they
perhaps based on your own experience with the outdated NZ phonesystem?
Yes? I thought so!

Have you ever wondered if maybe other countries have better systems
that works well with 28k8-modems? No? Well, time for you to start
wondering!

> what is wrong will all you
> Usenet readers, don't you have a life, ? or are you just STOS using
> teenagers, or is it you are just frustrated Atari users and just wish to
> take your frustration out on me.??

I admit to being a frustrated Atari-user, but to take it out on you?
What good would that do me? (apart from a good laugh ;-)

I`m neither a STOS-user, a teenager or a comms-expert. I resent your
feeble tries to categorize the ones criticizing you for the
bulls**t you post. One doesn`t need to be neither a STOS-user nor a
teenager to notice and respond to the crap you are spreading all over
the place.

> Them may be you do need a better computer...!!!

Yes I do, but that`s beside the point!

> Here in NZ the phone lines are rated up to 9600, if you can run faster
> then you are in luck, if you don't believe this go ring Telecom here...

I believe you. However, this flamewar started because YOU impersonated
some kind of global comms-expert, which you aren`t! Stating that 28k8-
modems are a waste of money might be true for NZ, but NOT for large
parts of Europe/USA. If you were a half-decent NZ comms-expert you should
have known that, which leads me to believe you aren`t even a NZ comms-
expert.

> So if you don't wish to listen to your elders that is your problem, but then
> again that is a Teenager thing, is it not...

Once again you are trying to impersonate a global comms-expert. And as
before you fail! You might be older than me and you most certainly know

more about the NZ phonesystem than me. However, I`m very sorry if this comes as a shock to you, NZ != WORLD.

You keep asking for facts to prove that 28k8-modems really work. Why do I need facts when 28k8 works great for me and most other people in this part of the world?

Well, that's not exactly true. Our user group has a wonderful
newsletter editor who works in a copy shop, and he has to either
ignore Calamus altogether and use PageStream or else convince the
owners of the shop to get rid of their EfiColor Fiery 150i Color
Server, Canon CLC 550, NEC model 95 and loads of other output devices
because DMC refuses to admit that their module doesn't work with any
of those PS devices. PostScript allows us to output our entire
magazine, any copy shop will have most fonts, and Calamus is the only
PostScript outputting program that refuses to work with the Fiery or
any of the PS devices. However, PageStream works like a charm, and
we have had no problem outputting to ANY PS device so far. Does DMC
not want copy shops to use Calamus? PostScript, no matter its
limitations, is a standard. DMC just said that the PS format in the
Fiery is faulty, but the server works with any other format except
Calamus.

I believe Yamaha UK themselves have the answer! If I remember
correctly they have some public domain software/shareware available
for their synth users who have Atari computers - and I believe an
SY35 editor/librarian is one of them! You'll need to ring them up to
ask for sure, of course.

(They also provide SQUIRREL - a librarian for the QY10, and
editor/librarians for their TG100 and TG500 General MIDI modules.
Wish Yamaha Canada would provide these (sigh) - I'd LOVE to get
ahold of anything official Yamaha made/had made for them for the
DX7II S I have here in my studio.....)

Roger Sheppard refused to answer a direct question and instead
offered this "cutting" insult to me:

S > Looks like you have never ever use a ACORN ARCHEMIDES...

S > Get a life go play with a ACORN RISK PC, or even better buy
S > one...

Now Roger, that's NOT what I asked for. Please don't skirt the
issue (or even a three-piece suit) - just answer the question - what
have you ever done for Atari users other than to put out abuse and
badly researched "fact" towards them.

And your precious little insults aren't going to stop me from
pressing on until I get a proper reply from you.

And I DO have a life, thank you very much. I'm over 30 and I
HAVE kissed a girl, and I don't live in my parent's basement - I
live in someone else's basement! :)

(for those of you who don't understand the above - it comes from
a SATURDAY NIGHT LIVE sketch in which William Shatner tells a
roomful of Trekkies to "GET A LIFE, PEOPLE!")

As for trying/buying an Acorn - hate to tell you this, Rog, but
Acorn has EVEN LESS SUPPORT than Atari does in North America - in
fact, the last Acorn computer I saw was at the Canadian Computer
Show back in 1991.

And I stand a better chance of finding/buying software/hardware
for my ST here in Toronto than I would for an Acorn. Not to mention
having OTHER ST users to help/help me out when a problem comes
along......

(To any Acorn users who may be reading this - I'm sure it's an
EXCELLENT computer.)

... I get into enough trouble without a tagline!

Well Backward 2.83 will soon be released (it's a matter of days) and Backward III
is on its way.
Backward III works on a different basis, it's now a TSR you put in your AUTO Folder.
But nothing has been done yet for the front-end. So I think, the first Backward III
versions will use the Backward II front-end.

That's only because the built-in GEM commands are broken - if you use
proper VDI and AES calls I understand GFA is a reasonably compatible
language.

I'm reading comp.dcom.modems for a while now and most people are quite
satisfied with their V.34's or V.FC's. It's mostly a problem of setting up
things correctly.

Of course there are always bug in new pieces of software. But if you buy a
decent model, i. e. with a DSP and Flash-Eproms, upgrading the firmware is as
easy as 1, 2, 3.

Hi,

Anyone manage to run Panic-94 on a Mega STE?

All I get is the siren and then a black screen, clicking the mouse will
produce 2 or 3 bombs. After that I get bombs whenever I rerun it unless
I coldboot the ST and get back to the siren with black screen.

Appreciate if someone tell me how to get this game running.

Regards
William

I have been able to get Panic-94 to run "occasionaly" on my Falcon with TOS 402 but it isn't very consistent. I've even had it in HI-2 color or even ST-Low but can't get it to run on my ST with Tos 2.06. IMHO, it is a very nice rendition, but with consistent 2-bomb scenario, can't see paying even the $5.00 right now.

194. CLA review in ST-Review

Newsgroup: comp.sys.atari.st
Date: 1995-01-05 10:40:19 UTC
From: Craig Graham <Craig.Graham@ncl.ac.uk>
Message-ID: <3egiaj$6jp@whitbeck.ncl.ac.uk>
Source record: 173553

Well, I'm proud to have been included in a small way in the final issue of ST-Review....CLA got a review!! The first review in an english language magazine.

Now the gripes begin.....

1) The copy reviewed was sent to them by a PD library when CLA is not meant to be distributed by PD libraries without my consent (which I have not given to Goodman International, the library in question).

2) The version reviewed is two years out of date.

3) I sent ST-Review/ST-User full registered copies of the current version for review last August complete with manuals, yet they still reviewed an old version sent in by a PD library instead?????

Not niggling grievances - especially when I have corresponded with members of the editorial staff of ST-Review on a number of occasions on a friendly basis before.

Joe Connor, Ofir Gal.....what went wrong? I know it's to late to do anything about it, as there's very little chance of getting a review in ST-Format - maybe I should convert it into STOS and get it to fade between pretty 320*200 pictures so it'll get a write up in Format ;) (appologies to Frank & Andy)

Craig Graham
- main author of CLA, and thinking of chucking it all in & retiring to grow tomatoes in the empty case from his falcon :)

>they be persuaded to fix it for multitasking TOSes?

I recently had some Calamus info: they have completely re-written the
code, and removed about 2000 bugs from it along with some unneccessary
loops. Calamus is going to be very cheap (the program), but most of the
modules that come now with it will be have to purchased separately.
And there will be only on version, and you can upgrade it to any level
by getting more modules.

...and I just hate that GFA-programs crash on my Falcon just because the GFA-guys forget a & :-). Can you have own libraries in GFA? When programming in C you just have to get a graphics library to make it easy. You don't have to write it yourself, though; just get a ready to go library on ftp :-). What I like about C is that when you realize what the &, -> and * are all about you have much more control of what you're doing to your machine (unlike GFA :-))

>It's just a matter of taste I guess, just as we are still using Atari's !
>But we shouldn't condemn something just because we don't know it or use it.
>Why else did they make a PC version of GFA Basic (and a good one too...)
>
Exactly! You should be allowed to program in whichever language you want to without someone whining about it! If you like C, assembler, Pascal, Prolog or even GFA-basic; go for it! If you want to do something; try to make the makers of GFA to write a compiler that creates legal code!

>without fiddling woth RIP's and stuff.
But most people don't have "high-end printing hardware"; they want to do draft prints to their own printer, then do a final copy on someone else's high end machine. Almost nobody in the UK can take a Calamus file from me and print it. Almost noone has even heard of Calamus.

> E. g. kerning problems due to missing fonts or different set-up's.
Fonts can be embedded in the PostScript file; I do this with PageStream.

---8<---------- Cut here ----------->8---

Section 1 Introduction - This section contains information on the M68000 family programming model, register description, integer and floating-point data formats and data types as well as information on format organization

in registers and memory. Also included is a table of notational conventions used throughout this manual.

Section 2 Addressing Capabilities - This section presents detailed information on the format of instructions and their various bit field definitions and possible encodings. Also included are descriptions of addressing modes and other data structuress used by the M68000 family.

Section 3 Instruction Set Summary - This section includes extensive information on the instruction set (grouped by operational category), descriptions of the operands used by instructions, and guidelines on how to use the instructions.

Section 4 Integer Instructions - This section provides all integer instruction (non-privileged) operations described in detail and organized alphabetically.

Section 5 Floating-Point Instructions - This section provides all non-privileged floating-point instruction operations described in detailed and organized alphabetically.

Section 6 Supervisor (Privileged) Instructions - This section provides all privileged instruction operationss described in detail and organised alphabetically.

Section 7 CPU32 Instructions - This section provides alll CPU32 instruction operations described in detail and organized alphabetically.

Section 8 Instruction Format Summary - This section contains all the M68000 instruction formats (binary), arranged by opcode.

Appendix A Processor Instruction Summary - This section contains a table listing of all the M68000 family instructions arranged alphabetically and cross-referenced to show which instructions are applicable to which processors. Each processor is also listed with a table of the instructions and the addressing modes that apply to that processor.

Appendix B Exception Processing Reference - This section presents information on exception vector assignments for the M68000 family and illustrations of exception stack frames and floating-point stack frames.

Appendix C S-Record Format - This section provides detailed information on the S-Record format.

That depends on the horizontal and vertical frequencies the monitor is capable
of. The sync is the problem here.

Some older monitors (e. g. NEC 3D) were able to do that. Newer models don't
even sync to ST-high.

I don't have the exact ST-frequencies handy at the moment, sorry.

> from a post from the USA about problems with connecting at 28.8...

Ranting? From my (very subjective ;-) point of view it looks more like it`s YOU who are ranting. I must remind you that this is an international forum. When you post an article like the one you posted some days back you really SHOULD include something about it being valid in NZ only. BTW, if you haven`t noticed it yet I have time after time told you exactly this. Maybe it`s time for YOU to "go read in what I posted".

If you in your original article had written something like "28k8 modems are a waste of money _here_in_NZ_" then this flamewar would never have happened. Your article was yet another flamebaith, but this time you stepped on one to many toes!

> So you lack facts in a BIG WAY....

What kind of facts do you need? The facts you provided were very informative about why some people are experiencing problems with high-speed modems. They described WHY there were problems, nothing more. What they don`t say is how wide-spread these problems are and where one could expect to run into them. Your whole argumentation is based on these incomplete facts so it`s really YOU who lack facts!

Since you wanted facts I will provide you with some cold hard facts: 28k8-modems works well for most people in Europe and USA!

Are you satisfied?

> And from many replies I have seen here you do need to get a Life,
> or may be a Acorn Computer, then may be you will stop picking on me....

: (which I have not given to Goodman International, the library in
: question).

I have a feeling that what Nial did with the PD section in STR was that he got a lot of the stuff from the networks (like from HENSA, cix, and maybe a.a), and read the newsletters I sent him, and then downloaded what he liked, and then reviewed it. He would then write down the names of the prominent ST PD libraries as ways of getting the software.

I could be wrong, but I started to feel that a lot of the software reviewed was taken from HENSA, due to the timing of the reviews.
Ofir, care to comment on this?

Copy minix.xfs into c:\mint or c:\multitos, whichever is more
convenient.

>wouldn't be enough.

Unless the file makes extensive use of 680x0 assembly, there is no reason
why a re-compile won't work (assuming the same OS calls on both processors)
Esp. if it's code written in C. Sure, maybe there are some optimization
issues and sometimes system calls don't work exactly they way they used
to but problems like this can be fixed easily (or at least *mostly* easily :)

Ex:
FAT Binary mac programs. Most of these are just the same code recompiled
in two versions and plopped into the same application file.

>The 68k-series used in MAC's and Atari's are compatible on the cpu-part. The
>difference is in the hardware (bus, video, sound) around it. These differences
>can be worked around, using OS-calls properly.
[snip]
>
>From what I've heard, the folx doing the Linux-PPC port do have all sorts of
>problems. This version is far from running. And Linux 68k-binaries are not
>compatible to PPC-Linux as well.

When you're talking about UNIX ports like Linux, the kernal is usually
just recompiled for the machine you're on (mostly because of the cpu).
All the other junk in the machine (sound, video, etc.) is all handled
through drivers. Porting a kernal is not hard, it's writing the drivers
that takes most of the programming time (at least that's what the
guys in the MacBSD docs said :)

The idea is that if you're running Linux on a Mac, Falcon, PC Box, etc.
that when you distribute programs they run on all of them so long as
what you're doing doesn't involve special hardware. How do you accomplish
this? You distribute source and it gets compiled on those machines.
Alot of stuff is distributed this way. Although, I will say that I have
seen commecial stuff and that is often times distributed in binary format
but more often than not you'll find these are for the "big boys" SUNs or DECs

running "regular" versions of UNIX.

I don't know what the future of a PPC Falcon would be but it seems to me
that if it's going to be running only Linux then it would just be one
of many different UNIX boxes with alot of interesting hardware.

Just my $0.02

In article g91@nyheter.chalmers.se, d2cg@dtek.chalmers.se (Christer Gustavsson) writes:
>
>Can you have own libraries in GFA?

Not in the true sense of "libraries" like you can implement in C. More like code-snippet toolkits that you can import into your own code. You can, of course, call any C or asm code through GFA, if you know what you're doing. :)

>What I
>like about C is that when you realize what the &, -> and * are all about you
>have much more control of what you're doing to your machine (unlike GFA :-))

All very true. C gives the programmer what I like to call "ultimate power" in that you can do whatever you want... even if it's downright stupid. :)

>Exactly! You should be allowed to program in whichever language you want to
>without someone whining about it! If you like C, assembler, Pascal, Prolog
>or even GFA-basic; go for it!

VERY well said, Christer! Each to their own and have fun doing it.
==========

>If you want to do something; try to make the makers of GFA to write a
>compiler that creates legal code!

Alas, GFA Systemtechnik is no longer interested in the Atari market whatsoever. DOS & Windows is where the $$$ is now, and they are having a difficult time in that market as it is, AFAIK. And do NOT tell me any more fairy tales about the Richter Company taking over development of GFA for the Atari.

What I would really like to see is a version of C with a high-level, easy to use interpreter like GFA's and an intuitive, GUI design interface like Visual Basic but coupled with a really fast compiler/linker. And I do NOT mean a lame product like that earlier C Interpreter (unnamed to protect the guilty). ;-)

Cheers,

This might occur because your mouse isn't well connected to the mouse port.
At least I have had that kind of problems when the mouse wasn't well
connected.
Hope it helps. If it doesn't, your port may be broken.

>the DTP program which all others are compared against.

Isn't Adobe illustrator a vector drawing package - not a DTP program?
Quark Xpress and Pagemaker are the DTP-programs.

What makes PS silly IMHO: you create a document, translate it to Basic-
style -file (PostScript), send it to printer which translates it back
to a raster image. And the quality , compability and speed comes from
how good are the translating programs and devices.

Why not send the raster image directly from the program to a printer,
as you do in Calamus SL? Results are the same, and you don't have to
pay extra for a PS-printer. Just a thought....

Lucky Tim :> I'll be interested to hear any further news you do get,
though.

> Say hi to the chaps at Ad.Lib for me!!
>
> Will you switch back to MBBS if the upgrade comes along? ;^)}

Too much work has gone into the Ratsoft setup, what with being the UK
Support site for it now. If Tim had been quicker with the upgrade, it
may have been a different story. I don't think there's a single MBBS
system in the UK left now, although a lot exploded into being after ST
Format gave it away on a coverdisk. Everyone has switched to Ratsoft,
QBBS or Octopus now.

IN> (two 256K SIMMs) are burned..
IN> What is the cause of that ?
IN> Is this because of overheating, is
IN> the transformer board bad ?
IN> Any other possibilities ?

Sounds like a very odd problem. "Burned" in what way? Excessive
voltage? If the "transformer board" (which I assume means the power
supply) were bad, all of the SIMMs would probably be damaaged, so I
doubt that it is the problem.

IN>And one more question: Is it possible
IN> to put PC SIMMs into 1040STE, and how ?

(1) Open the case.
(2) Open the SIMM cover.
(3) Take out the SIMMs you see there, and put in the new ones.
(4) close everything up again.

240. BIG Problem!!!! ST Freezes!

Newsgroup: comp.sys.atari.st
Date: 1995-01-05 22:53:22 UTC
From: hallvart@oslonett.no
Message-ID: <3eht92$deb@hasle.oslonett.no>
Source record: 173460

I have a big problem regarding my STe. It keeps locking up or "freezing" again and again, and I have no idea what the cause can be.

At first I thought the problem was within "STorm", but then I changed to "Connect", but the problem is still there.
I use the text editor "7up 2.09" a lot, and that's where it usually happens, but it can also happen withing "Connect" or other programs, but for the time being, "Connect" and "7up" are the programs I use mostly.

I can't understand why it happens, because it hasn't until recently, and I can't remember changing my setup regarding adding new auto programs or accessories etc.
What used to happen a lot was that while typing, the text would appear slower and slower on the machine and finally everything would freeze up, but that hasn't happened in a while, what has happened though is that while typing, suddenly there's no more response from the keyboard, and the mouse won't work any more either. I might still have the mouse pointer and cursor, but I can't type any more or access the drop down menus etc.
I also have the rotating "Fuji" logo on the desktop, and it usually still spins.

This problem has cost me so much lost work, so I have to make incremental saves now, and I use a reset-proof RAMdisk. The only thing that helps now is to reset the computer and continue from where the machine froze.

I thought this might have been a virus, but no virus program has detected anything. I've also been suggested that a program called "ovfix" should fix it, but it hasn't, and someone also suggested it was a keyboard overflow bug in TOS (or something like that).

Help!!!! What can I do??

Hallvard, Oslo, Norway

>
>Ah, at last! Someone speaks with a bit of sanity. Thanks, Hendrik. :)

I'm sure the original poster (hmm, his name seems to be missing above)
meant that the '060 would be much faster than a PPC emulating a 680x0.
The prices comparison is certainly true, however, and I sure would like
to have a FalconPPC.
The comment about the clockrate is not really valid, though.

One of the central ideas in RISC design is to reduce complexity to
make higher clock rates possible. This will usually be a good compromise
since the simple instructions are the most used ones anyway.

(In the following I've not considered that the PPC instruction set is
probably much better designed for FP etc. Only normal integer
instructions are considered and only very loosely.)

I'd guess that that the average apparent execution time of the PPC601
instructions is somewhere around 0.4-0.6 clock cycles.

For the '040 I've seen the figure 1.4 mentioned.

Given what I've heard about the '060, 0.6 does not sound impossible for
that processor.

Now, what does this mean?

Well, since a typical CISC instruction usually does more than a RISC
instruction, the '060 could very well be faster than the PPC at the
same clock rate.
But, the best '060s will not run at the same clock rate as the best PPCs!
^^
(Not with the average 0.6 cycles/instruction, anyway. They could of course
double the clock and have 1.2 cycles/instruction instead.)

The '040 has been available for a couple of years now and the fastest
ones available runs at 40MHz as I recall (No, they're _not_ clock doubled!),
which is probably not due to laziness on Motorolas part.

Its probably either an analogue or digital RGB monitor. The former will
be fine for low/medium - whereas the latter has a limitied number of
colours.

> Is anyone using one of these on an ST? Any harm in trying to connect
> it to my Ladbroke ST-VGA convertor box?

Probably not - though surely your box will have 15pin mini D connectors?

BTW MicroVitec are on 0274 390011

:-)

Roland.

I assume you are really taliking about the MINIX FS for MiNT as opposed
to the MINIX OS itself?

Anyway try putting the MINIXFS.XFS in a directory C:\MINT or C:\MULTITOS.

I put mine in MULTITOS as I'm running MTOS. OTOH I'm using the standard
MiNT 1.12 distribution binary so it should work for you too.

:-)

Roland.

Message-ID: <3ei4ug$q0f@charm.magnus.acs.ohio-state.edu>
Source record: 173565

If two of these messages get through please bear with me.

Sorry about the bug. I made a slight change in the program before sending it up to the net that shouldn't have made a da** bit of difference, but unfortunately it did. Anyway I have changed the memory manager so this problem appears to be gone. I have put it through a fairly rigorous test phase. Please excuse my rush on the 31st, but I wanted to get it on the net before I had to change the name. ;)

Anyway the new version is revision a. It's now up on atari.archive.umich.edu under Games/Space/panic94a.zip. There is also a copy of the binary only available under the file Games/Space/p94_2_a.lzh. If you already have downloaded the previous version get this and you'll be fine. If you see a copy of the other version floating about please let the archivists at that site know about the new rev.

So sorry again about the bug. Also if you have any suggestions or comments mail me or post it here. I'm open to new ideas and adding more sound tags (events which will start a sound) is really easy.

Dan Ackerman
aka baldrick@terminator.rs.itd.umich.edu

Sorry again.

> assume that I do not have to have to load anything special besides Flash
> to get it to work. Thanks in advance.

John - make sure you select a number of other options in Terminal Options.
In addition to selecting the IBM character set, you also need to select
ANSI emulation. You must also have Control Codes set to 7 Bit and
Character Codes set to 8 Bit. No other Terminal options should affect the
display of ANSI characters.

I use ANSI on a number of local boards with excellent results. Let me
know if you still have problems and we'll get them worked out.

I really really really really really need to know....

does this game REQUIRE use of the Jag controllers (or similar digital devices),
or can I use my regular analog joystick (perhaps in conjunction with the
numeric keypad?) to play?

The reason I am asking, is because I do not have a Jag controller, and this
kind of raises the price of the game if one is required.

Anyone?

Dave

251. Preliminary SAC Expo Announcement

Newsgroup: comp.sys.atari.st
Date: 1995-01-06 03:56:52 UTC
From: szhays@dale.ucdavis.edu
Message-ID: <3eif24$bk2@mark.ucdavis.edu>
Source record: 173470

Preliminary SAC Expo Announcement:

Planning has just begun on the 1995 edition of the Sacramento Atari Computer Exposition. This year the show will be held on April 22nd, 1995. As has been the case for the past three years, the show will be held at the Towe Ford Museum from 10 am to 6 pm. This year the show is being sponsored by the Towe and is being organized by STAR (Sacramento's Total Atari Resource) and YAC (the Yolo Atari Club).

We haven't even sent our vendor packets out yet and already several companies have told us they are planning to attend. These include: Oregon Research (of Diamond Back and Diamond Edge fame, as well as the US distributors of HiSoft's products), A&D Software (whose products include MegaCheck, Tax Wizard, Universal Item Selector, Universal Network and the WinterTree line of software--Spelling Sentry, Gram Slam and WinterTree Thesaurus--among other products), Gribnif Software (creators of NeoDesk and Geneva, and ditributors of STalker, STeno, Arabesque and Convector), Compo (distributors of Speedo-GDOS 5.0 and tons of other great German software), STeve's Atari Sales (one of the US's biggest Atari dealers), and ST Informer Magazine (one of the oldest ST specific magazines still in operation).

Please expect this list to grow. Updated information will be posted here in the future. I just wanted to get people to mark this date on their calendar as early as possible. Vendors interested in attending may contact YAC through e-mail at elhays@ucdavis.edu.

Message-ID: <3eijvb$ebs@nyx10.cs.du.edu>
Source record: 173572

Hello... I have the following system that I will be entertaining offers
for... it is an awesome system for the right buyer!
Atari TT030 in a steel tower case... 4 internal 5.25 inch drive bays
500+ meg hard drive installed
1.44 meg internal floppy
TEN megs ST ram; repeat here... that is TEN,
SIXTEEN megs TT ram... that's SIXTEEN megs TT ram
(26 megs ram combined total)
TTM194 19 inch monochrome (perhaps available seperately)
PTC1426 TT color monitor (also perhaps available seperately)
8 bit color video card (coco)
Standard TT video port works too, so you can hook up both monitors together
IMAGE SPEEDER interface to an image setter... VERY FAST lino output!
Keyboard, mouse, docs, box, disks, misc. included.

This is designed as a professional publishing and image retouching
system... the system was designed for the DIDOT/RETOUCHE suite of
programs which are not included, but easily acquired from various sources.
OF COURSE the system is completely exactly totally compatible with
all Atari software since it is a genuine Atari TT motherboard mounted
in the tower case.
Please direct offers, inquiries and replies to:

> Why not send the raster image directly from the program to a printer,
> as you do in Calamus SL? Results are the same, and you don't have to
> pay extra for a PS-printer. Just a thought....

Because PostScript does a number of things for you, and you need only one driver for all PS printers. Plus, programs like Calamus SL don't represent pages internally as raster data; they use vector objects for everything (except of course for the images in raster frames).

As an example, the PS printer I own (an Apple Personal LaserWriter 320, a 300 DPI PostScript Level 2 printer) offers resolution enhancement. This enhancement makes text and vector objects look nearly as sharp as 600 DPI output, as well as smoothing out very pixellated bitmaps. If it weren't for the PostScript layer, this would require extra drivers for all programs which wished to use resolution enhancement. With PS, the computer just generates the same old PostScript file, and the printer takes care of any image enhancement methods that it allows.

PostScript also offers standardized color printing, color matching features (on Level 2 printers), and a whole lot more. I can print to disk with PostScript (the Apple LaserWriter PS printer driver lets you redirect the PS output to a file). I can then take that PS file to any PS printer and print it. The output will be at the full resolution of that printer, whether it's 300 or 2400 dpi.

Calamus SL is nice if you can buy one of the high end output devices that it directly supports. Otherwise, it's not too useful.

> wouldn't be enough.

Uh - actually, yes, it would. Re-compilation = different binary. If you have a C program that runs on 68K machines, you can re-compile it with a PowerPC compiler and then it runs on a PowerPC machine.

Now, the PowerMac is not quite that simple. In order to allow PowerPC code to run concurrently with 68K code in emulation, including having much of the OS still written in 68K code, Apple had to make a number of changes in the way that PowerPC programs do function calls. Thus, if you want to recompile your old Mac program to be PowerMac native, it's often more of a job than a simple recompilation - some modification of code is usually necessary. (Especially if you have to switch which compiler you're using.)

> From what I've heard, the folx doing the Linux-PPC port do have all sorts of

> compatible to PPC-Linux as well.

The people doing the Linux-PPC port are having problems getting information on the low-level hardware of the current PowerMac line, as I understand it. They will probably have an easier job writing it for CHRP and/or PREP (the two standardized PowerPC platform specs, with CHRP being the descendant of PREP and more likely to be the long-term standard).

I went to a garage sale a while back, and they guy used to distribute ST software. He had scads of disks....don't think I've seen that many floppies before.

Made me wish that I'd gone there when I had my ST. Then, I started thinking about the "Gemulator" deal from Branch Always Software. Now all I have is an MS-DOS clone - 66MHZ. The Gemulator costs $99 - and consists of software, and a bus card which requires ST ROMS. Anybody have any experience with this outfit? I'm sure it will bring up the GEM Desktop and look pretty, but will it **really** run ST software? Be pretty cool if it will. However, what is the cost and availability of ST ROMS? The last ST I had used TOS on floppy disk at first, then finally got the ROMS, but only the first version. How many revisions have there been? Somewhere in a huge box of 8-bit hardware, I thought I remember seeing some TOS ROMS called "Rainbow TOS" - or so somebody wrote on the baggie that they are in...no telling what they really are. Why is this called Rainbow Tos?

Replies appreciated.

James Wood

260. problem with gdb

No, the Spectre GCR lets you run Mac software on Ataris. MagiCMac lets
you run Atari software on Macs (ie the reverse).

Gadgets by Small have gone bankrupt, by the way, which is not too
surprising as they didn't support their customers for several years,
and never got around to upgrading their software (maybe they did, but
they never released any of it).

Hmmh, this really sounds strange. Might come from minor thermal-movement.

Perhaps you could open your machine and press all the chips firmly back into
their sockets. Or even remove them, clean the contacts (i. e. with a
glassfibre-pen), and put them back again.

That's all I can say.

>One of the central ideas in RISC design is to reduce complexity to
>make higher clock rates possible. This will usually be a good compromise

Ok. But I think a 060@60MHz could be faster as a 601@40MHz. The point I wanted to make, one should always mention the clockrate when comparing figures, to make things comparable.

>_But_, the best '060s will not run at the same clock rate as the best PPCs!

Agreed.

>The '040 has been available for a couple of years now and the fastest
>ones available runs at 40MHz as I recall (No, they're _not_ clock doubled!),

Correct. 25, 33, and 40Mhz. Although some 3,3 volt models have an internal double-clock for some logic-parts. But _not_ for the IU and FPU.

The 060 is available for 50 and 66MHz. No double-clocking either. The 060 can acess the bus with a reduced clock and can therefore be used in an 040 environment.

Yeah right. I'm as well busy reading the German MausNet groups related to comms and stuff. The guys there seem to be quite happy as well.

What _exactly_ is your problem with V.34 (not counting your bl**dy phonesystem)? V.34 modems or the USR V.everything are neat machines. And with the latest December-firmware they seem to work quite stable. One does not get a 28k8 connection _all_ the time, but 26k4 or 24k0 isn't all that bad either.

One big advantage of V.34 is the faster speed-negotiation during the connect phase. That's definetely faster than with V.32 transfers. They introduced a special V.8 mode to accomplish that.

Personally I'll go for E(uropean)ISDN. That's for sure ;-)

>There is not support in upgrading these modems with a Atari, you need a

Not yet, that is. IIRC, someone managed to do it even without the software from USR. Only by sending the proper AT's.

And raster images (TIFF's etc) have to be saved as bitmaps in PS too.

>As an example, the PS printer I own (an Apple Personal LaserWriter 320, a

>computer just generates the same old PostScript file, and the printer
>takes care of any image enhancement methods that it allows.

Postcript has nothing to do with the printer's capability to do a
resolution smoothing. I use H-P Laserjet IIIP, which has 300 dpi
+ RET, and the RET works for *every* program - it is set up in the
printer menu, not from the program. And I suppose the Apple printers are
HP's with a new logo and PS/Appletalk.

>PostScript also offers standardized color printing, color matching
>features (on Level 2 printers), and a whole lot more. I can print to disk
>with PostScript (the Apple LaserWriter PS printer driver lets you redirect
>the PS output to a file). I can then take that PS file to any PS printer
>and print it. The output will be at the full resolution of that printer,
>whether it's 300 or 2400 dpi.

Calamus SL offers color separation, Pantone colours, colour printing in any
resolution - If you need it, there's a module for it.
File sizes of eg. pages that are saved as 24-bit TIFF's are big, but there
are always removable media - you need it for PS as well, as there are
nearly always raster graphics with documents.

>Calamus SL is nice if you can buy one of the high end output devices that
>it directly supports. Otherwise, it's not too useful.

I thought we were talking about PS-printing vs. Raster printing, and not about how "useful" Calamus SL is. You can get a PS-module for it, if you need it. :-) I'm not saying that PS is not good, but if you need true WYSIWYG, it's "not so good" in some cases, due to font substitution and translating devices.

|> newer version of gdb (without this problem)?

Newer version of gdb (since 4.0) use the BFD (Binary File Description)
library as an interface to the executable format. But nobody has yet
written the support for the native GEMDOS (st-out) format, which would
be required for gdb to read the executable (even if there is a
separate symbol file in a.out format). The changes to gdb 3.6 (which
is the base for the current gdb for atari) to support the st-out
format are a gross hack that does not work for BFD. That's why we
currently must live with the limitations of gdb for atari.

Andreas.

It could be the demo, there was one on a coverdisk from a UK magazine
called "ST Action" years ago...

> AFAIK this game was only ever released in a compilation type format with
> the computers, and is virtually impossible to obtain any other way
> since Atari hid it from everyone.

Nope, it was released on it's own, at least in the UK. Compo were
selling boxed copies of it at an Atari show in England last summer for
3ukp :-)

Actually, slight mistake above.....

All flavours of Linux68K are supposed to be binary compatible - a binary
compiled on a Falcon should run on the Mac, or the Amiga without any
need to re-compile, so no requirement for a source distribution if you
don't mind restricting your program to Linux68K users.

Small point, but important.

Craig.

: style -file (PostScript), send it to printer which translates it back
: to a raster image. And the quality , compability and speed comes from
: how good are the translating programs and devices.

: Why not send the raster image directly from the program to a printer,
: as you do in Calamus SL? Results are the same, and you don't have to
: pay extra for a PS-printer. Just a thought....

By having the Postscript capability in a program means that your print shop does not need to have the program that you are using to create the document on his computer. Let say you use Page Stream on your TT and want to print your document on a Lino, you don't have to run around to find out which print shop have the TT in there shop as if you were using Calamus SL. As far as the result is concerned, it is not quite the same. I noticed the "Postscript" print out of text are sharper than let say HP. Try this on your Postscript printer and if it emulates other printer, just send a plain text both in Postscript and whatever it emulates, you'll see the different.

>called Rainbow Tos?

Many questions...

Yes, the Gemulator does work and surprisingly well. I've used one
extensively on a 486-DX33 and a 486-DX266 (back when I didn't know better). :)
For smoothest operation, you DO need a fast PC so if you have a 66DX2 you
are in good shape. It installs easily (hardware & software) and using it is
a snap. Some features (such as changing resolutions) are nicer than Atari's.
It works pretty well for everything but games and MIDI, but I haven't read
his latest flyer yet so don't know what enhancements are now available. At
least the product is actively supported, which is important, nowadays. IMHO,
the Gemulator is -not- perfect, but it does what it claims and does so well.

Branch Always Software has been around for a long time. Darek Michoka has
a lot of experience with emulators and knows his stuff. You can contact
him directly for Gemulator info at darekm@microsoft.com.

Last I checked, Atari TOS 2.06 ROMs went for about $60 from Atari dealers.
Finding an Atari dealer is the hardest part, but you can always call Toad.

TOS 2.06 is the latest official TOS release for MegaSTe class machines.
The TT uses 3.x and the Falcon uses 4.x series TOS. TOS 1.4 (actually,
1.04 but who cares?) was a vast improvement over 1.0 and 1.2 and was known
as 'Rainbow TOS' because of the rainbow-fuji effect you see when call up
the 'About' TOS info box.

>released? I believe it was last March Dave said it just had to be copied
>and documented. Has anything happened since then? Does anybody know?

They have gone out of business, Paul... what do YOU think that means?

Unless Dave Small licenses his Spectre code and proprietary knowledge to someone
else (if he chooses to and it's permitted by the Chapter 11 proceedings), then
it is doubtful it will ever see the light of day. I like Dave a lot, but I have
serious doubts that 3.1 was -ever- really that close to being released, IMHO.
And no, I wouldn't count on it being released into the public domain, either.

Spectre GCR was great in it's day, but that time is now past. I'm personally
sorry that Gadgets by Small came upon hard times and I sympathize with their
many customers who were upset about the lack of support the last few years.
Still, I can only wish Dave and Sandy Small good fortune in the future.

>
> I don't have the exact ST-frequencies handy at the moment, sorry.

You need a horizontal freq that will go down to 15kHz to do low-res. Mid-res
and hi-res are both 30kHz horizontal. Vertical needs to be from 50Hz (lo + mid)
to 72Hz (hi-res).

I had one SVGA monitor working fine on my ST, but haven't been so successful
with my current one - partly because it won't sync down to 15kHz.

294. GFA-BASIC

Newsgroup: comp.sys.atari.st
Date: 1995-01-06 20:00:25 UTC
From: hutch@ilmen.lanl.gov
Message-ID: <9501061901.AA00741@ilmen.lanl.gov>
Source record: 173527
Cross-posted to: alt.lang.basic,comp.lang.basic.misc,comp.sys.atari.st

Someone was recently asking about GFA's new USA address which I did not have available at the time. Well, here it is:

GFA Software Technologies, Inc.
c/o PTR-Precision Technologies, Inc.
120 Post Road
Enfield, CT 06092

Fax: 203-745-7932 (voice number unknown)

The flyer I got in the mail from them announced the new version 4.51 GFA BASIC for DOS -compiler- which creates true, standalone executables (no overlay library or runtime file needed). The price was listed as US$99.00 + $6.00 s&h (+$4.50 COD, if desired). Note that this is for the compiler ONLY. You still need the GFA BASIC for DOS interpreter version 4.51 or higher (no price listed).

Some specs/claims from the flyer are:

"...create programs that run as fast as programs written in C"

"...DOS compiler is supplied with Optlink, possibly the fastest and most efficient linker on the market." (same one that comes with GFA BASIC for Windows, I believe)

"Compiler options include: use 386 instructions only ... emulate 80x87 code or use real 80x87 option..."

"...75 page manual which includes sections on the Compiler, Linker, speed optimization, linking C and assembler code."
(let's hope that GFA's documentation has improved this time)

From past experience with the GFA BASIC for DOS Interpreter, I can say that this compiler must be welcome news. While the pseudo-compiler they previously used (much like Visual Basic's) compiled source into .exe's, it still was only as fast as the interpreted code (which wasn't bad). If this is as good as GFA for Windows, the .exe's should now scream.

Past GFA BASIC for Atari programmers should note that the syntax (and editor, good or bad) of both DOS & Atari versions are very similar.

Anyhow, it might be worth a look.

>driver for all PS printers. Plus, programs like Calamus SL don't
>represent pages internally as raster data; they use vector objects for
>everything (except of course for the images in raster frames).

One BIG advantage of Calamus IMO. You can zoom deeply in to every object and it is still very fast. You can position objects _very_ exact. You cannot do this with QuarkXPress, can you?

>300 DPI PostScript Level 2 printer) offers resolution enhancement. This
>enhancement makes text and vector objects look nearly as sharp as 600 DPI

So? If you print e. g. on a HP with RET, you have the same edge-finetuning as you've mentioned it. But this is entirely done by the printer (smaller or bigger pixels by manipulating the focus of the laserbeam).

>PostScript also offers standardized color printing, color matching
>features (on Level 2 printers), and a whole lot more. I can print to disk
>with PostScript (the Apple LaserWriter PS printer driver lets you redirect

You can do that with Calamus as well. One big problem of PS are the different implementations in the printers. Not all models use the original Adobe-chip but a cheaper clone. That often causes all sorts of problems.

>the PS output to a file). I can then take that PS file to any PS printer
>and print it. The output will be at the full resolution of that printer,
>whether it's 300 or 2400 dpi.

That's true.

Apple is _very_ restrictive with their information about the hw-layers, aren't
they?

>understand it. They will probably have an easier job writing it for CHRP
>and/or PREP (the two standardized PowerPC platform specs, with CHRP being
>the descendant of PREP and more likely to be the long-term standard).

Well, PREP isn't even established yet and now Apple, IBM, and Motorola pull a
new standard out of their hats. The Common Hardware Reference Platform -CHRP-
could be a good idea. MacOS, OS/2, or NT will be available for these babies.
Or even NetWare, Solaris, AIX, or Linux.

MacOS still requires ROM's. THAT could be disturbing factor, as it has been in
the past. The best thing about CHRP is the PCI-bus and the OpenBoot-Firmware
standard, which Apple and IBM have already licensed from SUN.

This will hopefully be a main contender against unINTELligence ;-)

Remove the mains-supply and move the switch a couple of times. This might
remove the resedue from the surface. If you have someone to take a closer look
in to the PSU you could use some contact spray as well. And move the switch
again. Let the spray dry and then reconnect it back to the mains and give it
another go.

HTH!

>called Rainbow Tos?

This referres to TOS 1.04. When you display the desktop-info in colour modes,
the Atari-Fuji (/|\) is displayed in colours of a rainbow. That's why.

I'd recommend the use of TOS 2.06, though. It has a much nicer desktop an
other improvements over former versions.

I wonder if one could put Mag!C into Eproms and use them with GEMulator. Or
doesn't work Mag!C at all with it?

Wouldn't we all :-) But surely a Visual Architecture program could be written
which then generates C source code - a bit like an extended RCS?

> product like that earlier C Interpreter (unnamed to protect the guilty). ;-)

:-) I learned to program in C with that program. And very soon moved over to
over to Lattice (the other end of the spectrum and handled by the same company
over here!). I remember when ST User gave ST User away on a coverdisk they got
someone in to do a C tutorial and by the end of the series he was virtually
writing the program twice - once for all C implementations on the ST, and once
for HiSoft C Interpreter - by using #defines :-)

S > get out of the Kitchen...

You know, a thought just occurred to me.

Roger says that anyone who doesn't have an Acorn computer
doesn't have a life?

Roger, do YOU own an Acorn?

If you don't, then judging by your own narrow standards you
don't have a life either - and therefore have no right to pass
judgement on other Atari users - many of whom enjoy using an Atari
computer to the fullest, no matter which model - from the
not-so-humble 8-bits, to the STs and STes, and to the TTs and
Falcons. And who are doing, your regal 'ship, what you deem to be
impossible - including using CD-ROMs, and 28.8 modems, as well as
getting positive, constructive work done. Who conceivably also
include a number of teenagers who use GFA Basic and STOS to their
advantage. :)

Maybe YOU should be the one to buy an Acorn and get a life -
then maybe you'll leave us alone with your whining authoritarian
attitudes. Sometimes you act like you're sore because you don't have
an Airedale to kick :). I only feel sorry though for the poor Acorn
users who'll have to put up with your insults and disinformation.

(Standard disclaimer - I'm sure the Acorn Archimedes is a great
computer, with lots of uses. I'd LOVE to try one - if they were
available in North America. If I'm ever in Europe in the near future
I'll be more than happy to try one and give it a chance).

As you said, Roger, if you can't stand the heat........

... That was setting #1. Anyone want to see setting #2? - Guinan

I imagine that announcement in the catalog was just a bit too premature based on what they -expected- Dave to deliver prior to press time. Toad's new catalog has been out a couple of months, BTW. I sent them email to doublecheck, though.

Ok, I think I've found the source of the bug, that is killing the game for some of you. It has to do with how the sound system is detected. From what feedback I've gotten so far, it seems that rev. a fixed the bug for people with DMA sound engines. So if you have a Mega hold on if you can a couple of days, and I'll get the problem hammered out. If you only have a stock 520 or 1040, i personally have to admit you may want to pass on this game. As it makes heavy use of the Blitter chip and the software emulation on the original machines has a hard time dealing with all the data.

Anyone else having any problem, once the game boots?

What about the fonts? Are they stored in that PS-file, or does it require EPS?
(Could anyone explain the diff's between those two?) If the files are not
encorporated in that particular file, one does need a programme to print the
stuff out. At this point you get into trouble when not all fonts are
installed and you've got to substitute, or the fonts aren't 100% lookalike and
all your kerning and layout goes down the drain. I've seen this so often at a
friends company.

I don't want to drag around this too much. Both systems have their pro's and
con's. The possible errors in the fonthandling is a _big_ minus at PS, the
easy portability and res.-independence a _big_ plus.

Calamus, on the other hand does all the stuff the RIP would normally do, and
therefore you won't have the font-problems (++). But you're _very_ dependant
on a shop with Calamus compatible high-end printing hardware (I'm looking for
another vocabulary here, but cannot find it ...) to use a Hell or Lino.

>
> Roland, could you possibly explain why a RGB monitor is limited in
> colours?

The way I understood it was that there are 2 sorts of RGB monitors,
analogue and digital.

Analogue ones take analogue voltage RGB signals and hence provide almost
infinite colours.

Digital ones have some sort of 'stepped' voltage, something like 7(? 3)
gradients between 0v and 5v. The number of colours represented by this
system is much more limited.

Now Atari RGB monitors are definatly analogue. However I've been told that
IBM CGA monitors are digital RGB montiors and so can't be used with Ataris.
I've also heard that some CUB monitors are used with BBC micros were also
digital in this respect.

Now I might be very much mistaken - but this is what I've been told at
various times.

:-)

Roland.

>
> IMO, that's not correct.

Not being Roland, may I reply? A digital RGB monitor allows only 2 levels
of colour from each gun - on and off. Hence, the maximum number of colours
obtainable is limited to black, white, the three primaries, and the three
secondaries. Analogue RGB, howver, allows an infinitely variable level of
each colour gun, thus allowing any shade to be produced.

.net is no doubt referring to the Mosaic type program ZFC have discussed
doing in this very newsgroup. There have also been rumors of a second
Mosaic type web browser, but I don't have much faith in them. I've set
aside $60 to buy the ZFC one (assuming I can line up an IP connection).
Meanwhile there is the text only browser LYNX.

312. Problems With Floppy Drive

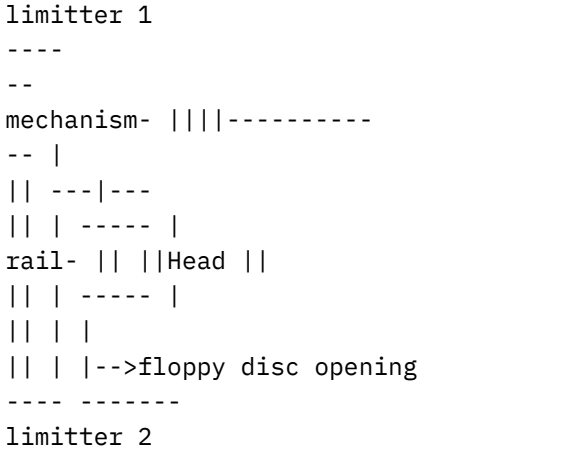
Newsgroup: comp.sys.atari.st
Date: 1995-01-07 02:33:22 UTC
From: npetrlik@public.srce.hr
Message-ID: <3ekuhi$kif@nippur.irb.hr>
Source record: 173508

Hi To All !

I'll try to explain my problem:

My floppy drive acts a little bit strange. When I want to format floppy disc with for expl. Fcopy (80 tracks, 9 sectors) it happens this:
-Fcopy, like the other popular formatters format a disc from the last track to the first track - backwards (in my example from track 79 to track 0)
-Fcopy starts formatting: 79,78,77...10,9,8,7,6...and then Alert Box appears: "Floppy Head Has Reached Track 0"
-My drive can physically format a disc to max. 84 tracks (00-83)
-Now, I've set format parameters to 84 tracks (00-83), 9 sectors. Before that, I've opened the floppy drive completely, and start to watch the head moving. The head's normal position is on track 0. The head mechanism is moving along small rail (I don't know the exact word for this) which have two limitters. First limitter (limitter 1) is for track 0, and the second (limitter 2) is for the last track (track 83).

The Ilustration:



-when Fcopy starts formatting (with parameters 84 tracks (00-83), 9 sectors) the mechanism darts forward to limitter 2. As I say, the limitter 2 should be limitting the mechanism position for the last track (83). Logically, the mechanism must drive to the track 83 (to the position where, actually, is the limitter 2). But, the mechanism drives to the position few tracks before limitter 2, and HERE IS THE PROBLEM.

Floppy head started on a wrong track!

Is this is a mistake of a floppy disc, or a controller's mistake?
...or could be something worse ?

I had a similar problem with Fast-Copy not formatting my disks correctly, just use a different formatter (DC-Format is one of the better ones IMHO), and the problem goes away. F-Copy works fine with my STe, but it didn't like formatting disks on my STfm, although it would copy disks with format+write turned on. (e.g. I could copy a 82 track disk with FCopy formatting the track before it wrote to it, but I couldn't just do a straight format of an 82 track disk). I'm not sure why this problem occurs, but FCopy doesn't seem to like some TOS versions (<1.2) by the looks of things.

Does anyone know of an Internet site or BBS that has the file RAISINS.SEQ,
which is an animation of the "California Raisins" of the 1980s?

I downloaded it several years ago; when I tried to run it tonight there
was some problem with the file as I got a string of bombs on the screen.
(Other *.SEQ and *.DLT files from circa 1986 still run OK, so apparently
something "happened" to that one file on the one floppy.)

Thanks!

Your Track Zero senser could be out, or your disk drive is no able
to handle 83 tracks, so try running DC max track I think its called,
the controler IC does not know if it on 80 or 83 when the disk is blank, it
sends the head to the end stop, then formats in, but if it can't handle 83
tracks, it will come up with the Track zero error....

Sony drives only get 82 tracks....

That was with me.. the trouble-maker. :-) Thanks for the followup.
[I don't think this discussion is inappropriate for a public forum, but
if folks disagree, say so and I'll just e-mail Hutch on this topic.]

> I recently stated that a PowerPC-based Falcon would make more sense, IMHO,
> than a 68060-based unit because the PPC could emulate 680x0 software with
> very little, if any, performance decrease until PPC native software arrived.

I disagreed with this because of what I had been hearing in a number of
venues, including MacUser and MacWeek. In fact, I had read that Apple
had already come up with an improved ROM version of the 680x0 emulator,
which was "twice as fast" bringing it up to mid-range 68040 performance,
but that they were reluctant to release it because they felt it would
reduce the motivation for developers to do native ports and get a big
speed boost.

> I also stated that my Apple PowerMac 7100/66 seemed to be every bit as fast
> in emulation mode as my 32MHz Apple Quadra 660av, although that was by my
> rather unscientific 'seat-of-the-pants' method.

I found that a bit surprising, based on what MacWorld had to say. Of
course, they could be wrong, which is why I was hoping to get more info.

[As a further (unscientific) side note, my wife just replaced her 32 MHz
Quadra 660 AV at work with a PowerMac 7100/66, and felt that the PowerMac
was "somewhat slower", which tends to support Hutch's general theme.]

> OK, I've finally run a
> benchmark using the latest version of Speedometer (a Mac benchmark utility)
> on both machines

I appreciate you taking the time to get some real numbers on this, to
back up your seat-of-the-pants evaluation. One question I have though
is, does your 7100 have a cache installed? (This boosts effective speed
about 30% in the MacWorld tests).

> and the PR (Performance Rating) is as follows:
>
> PowerMac 7100/66 Quadra 660av Quadra 650 PowerMac 7100/66
> (68K emulation) (040 at 32MHz)* (040 at 33MHz) (native PPC mode)
> ==

> PR 1.20 1.53 1.56 3.97
>
> *The 660av tested has a 25MHz 040 clock-doubled to 32MHz.

You mention later that a PR of 1.0 is equal to a 25 MHz 68040, so I'm wondering how a 28% clock speed increase gave you a 53% performance boost?

Another question I might have is what instruction mix is the Speedometer testing? Is it a valid indicator of real-world performance? Does it take into account the slow-down that results from switching back and forth between emulated and native modes?

> So the bottom line is that while the PPC -is- somewhat slower, it's
> nowhere near the 2 - 2.5x slower than a Quadra 650 (as the MacWorld
> article supposedly stated). Of course, your mileage may differ. :)

The article was in the August 1994 issue of MacWorld. Overall, they were extremely enthusiastic about the PowerMac, and effusive in their praise. They also gave it 5 stars, and indicated it would become the new desktop standard. Their comparison tests showed that when running native code, the PowerMac was 1.5-4.5 times faster than a Quadra 650 (averaging from 2-3x for most tasks), but that its video speed was somewhat less than the Q650.

But when running emulated code on their standard suite of real-world benchmark applications, they came up with Core Performance indices that were quite disappointing (my words, not theirs). Their tests showed the 7100 as running 2.5x slower than a _Centris 650_ for the Common tasks, and 4.4x slower for the Scientific mix.

On the CPU group they showed it running 2.4x slower, 1.6x slower on video performance, and 14.5x slower on floating point. (The floating point performance is no surprise to me, considering the implementation. But the rest of the results were. I remember wondering how they could be so upbeat about such a step backward.)

> And just to keep things in perspective, realize that a 'lowly' 25MHz 040
> (which is equivalent to a Speedometer PR rating of 1.0) is about 5 times
> faster than a 16MHz 030 installed in our Falcons.

Dependent, of course, on what video mode the Falcon is running in. I'd say the 'lowly' Mac is 3x-7x faster than a stock Falcon, depending on video mode.

What about heat? I've had some wierd things happen here before (not like yours mond you), but strange.. this happened after the computer was on for sometime, actually mine are rarely off. I installed a small brushless fan inside, and all has been fine since. Only thing I can think of.
OH! what about a bad simm?? I had one go flakey on my BBS system.. want to see wild things happen. It turned out to be a bad simm (1 out of the 4). I found out which simm by using a memory tester.. its been fine since I replaced it. The bbs could run for days then all of a sudden it would go, next time only hours maybe.. eventually I couldn't keep the bbs running.

Those are my thoughs.. take 'em or leave 'em! :-)

323. Stardust

Newsgroup: comp.sys.atari.st
Date: 1995-01-07 05:16:01 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3el82h$3hs@golem.wcc.govt.nz>
Source record: 173417

The copy of Stardust I ordered from Aggression turned up the other day, and it certainly makes good use of the graphics, but for those of you who haven't seen Stardust on the Amiga (of which I was one), it is essentially Asteroids with much improved sound and graphics, as well as more nasties and some extra weaponry. You also have shields, and energy which can sustain a couple of hits, and you can pick up smart-bombs which will obliterate everything on the screen with a very nice graphics-effect.

Basically, the plot involves the usual bad-guy trying to take over the universe, but this one uses ships "disguised" as meteors which when shot break up into smaller pieces, which can be shot again, which break up into yet smaller pieces, which when shot disappear, (explode), sometimes leaving behind a useful(?) bonus such as extra energy etc. The explosions are VERY well done, I wouldn't like to think how many frames are in the explosion, or how many there are in the rotation of the meteors, which give a good 3D impression. There are numerous extra-nasty bad-guys, such as huge rotating 3D balls (ever seen the "boink" demo?), and huge things resembling thorns which take up almost half the screen.

There are also end-of-level bosses which get progressively harder (it took me 3 of my 5 lives to kill the 2nd one, although I'm getting better gradually :), this is _not_ an easy game!

As well as the asteroids-like stages, there are the mid-level tunnel stages (as seen in the SDTUNNEL.LHA demo), and special-missions which are similar to the game "grav" or "thrust" in which you have to fly around a cavern, trying not to run out of fuel, and picking up some extra lives along the way.

The whole game shows a lot of work put into the sound and graphics, and the gameplay is flawless, with collision detection being superb, not _once_ have I said "Yeah, right that was anywhere near me" (ever seen the game "Shadow Warriors"? The bad-guys hit you if their punch/kick is about an inch on the screen away from you! Good ole' Ocean!). The spot effects could be clearer (The robotic voice saying "Powerups re-routed to three-way" took me a while to work out.) but they fit the atmosphere, and the explosions etc. are better than any other such thing I've seen before on the ST.

All in all, a pretty good game, but under all the fancy extras, it's basically Asteroids, (A damned GOOD asteroids, but...) lets hope Aggression puts out an original game of a similar calibre! (Utopos was pretty good, but none too stable, but I haven't got the latest version that comes with Stardust yet (coming in a seperate package), so I'll save judgement a bit longer on that :)

Not bad for $20, and a lot better than some of the rip-off prices that Shareware authors charge for their nowhere-near as good attempts. (This game game with a commercial-quality _corrugated_ cardboard box (none of this wussy 1mm thick cardboard), looking just like what you'd buy in a shop, as well as a rougly A2 sized poster, and instruction manual (which is a bit sparse, but enough).

Oh yeah, and I've yet to find any bugs in it other than a couple of minor spelling mistakes! I'm well known for my ability to find problems with programs, something my coder friends get quite sick of, and Stardust has so far passed the test! ;-)

WELLS_S@IX.WCC.GOVT.NZ I am in no way affiliated with the Government Steve Wells. or City Council.

Programmers produce "Crappy" programs, not programming languages.
There are ways to right ANY program to make it crash on any system
other than the one it was intended for. Besides, look at how many
games will not work on the TT or the Falcon or even an STe. Does this
mean they were writing in a BASIC language ? And I can name several
(if not lots) of very good programs that may not run with Multi-Tos
or Speedo or Geneva or Magic.
If you can argue any of these points, please go ahead, show your
ignorance again.

From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <3elc1j$67p@charm.magnus.acs.ohio-state.edu>
Source record: 173523

Ok sorry about that one. Lets run down the history for my own humiliation
;)

panic 94 no rev - runs on my falcon and sometimes other peoples (Bad)

panic 94 rev a. - Seems to be sucessful on all falcons. (better)

panic 94 rev b. - Runs on my Ste and Falcon so hopefully all DMA machines.

Unfortunately it still won't run on older machines. I think I know what
the problem is, I just have to keep my old 1040 running long enough to test the
program. So it now stands that, tomorrow I will attempt to fix the bug for non
DMA machines. If this doesn't work, I will release rev. b so that at least DMA
users will be able to play it. Hopefully though rev b. will be able to handle
all machines. Either way expect a new revision some time saturday night U.S.
eastern time.

Thanks to all of you who have put up with me through this.

Message-ID: <3elg0p$iqb@er6.rutgers.edu>
Source record: 173539

Now, I've heard a lot about the WWW, and even understand it a
little bit. What *I* want to know is when a mosaic program will be
available for the ST? No, I am not even slightly interested in the
WWW text reader that's available. I want what the Man and IBM people
think is only possible with a Mac or IBM! I know it can be done. Are
there really no coaders for the ST anymore?

Could someone mail me and explain this to me?

V > To be fair to Roger, he has helped HENSA's Atari section by
V > uploading quite a few pieces of software from Genie. Thanks
V > Roger.

Now if only Roger told me that, rather than to ignore my questions and heap abuse upon me (like calling me a liar in this conference) and my choice of a computer. Seems he's done SOME good for the Atari community at large - and I commend him for that.

V > As for his 'carping, whining," etc, he is entitled to his own
V > opinions...and from what I gathered, he is just complaining as
V > we all usually do privately, about Atari not upgrading their
V > machines...no support whatsoever. OK, I do admit though, that
V > most of this stuff should be in advocacy...so Rog, please take
V > most (if not all) of your whines to thast conf.

Maybe so - but when those opinions are half-baked, mistaken, and just plain WRONG, one has the right to correct another without having to endure torrents of abuse and insults. I'd like to hear Roger say "I was WRONG" for once when he's corrected, rather than to be instead getting from him "you're a liar who hates your Atari and wants to shoot the messenger - and you're probably a snotty teenager who uses STOS".

You're right about Roger taking his anti-Atari stuff to advocacy. It has no place in this conference, which is supposed to HELP other Atarians - not tear them down. I have nothing against constructive criticism here (and indeed we all have a beef with Atari Corporation's lackadaisical attitude towards their computers) - but I have something against rude behavior, wrong facts, and computer-baiting. Roger makes Ralph Mariano look like Miss Manners :)

On a lighter note, it looks like the Atari Computer Exposition (ACE) '95 show in Toronto, Ontario, Canada (April 1st and 2nd - no, this is NOT an April Fool's joke!) is going to be a real corker - word is System Solutions may be coming here with hardware (it's not been confirmed yet). Atari HAS CONFIRMED they're coming, and they may have a very positive surprise for us as well.

ACE is being put on by the Toronto Atari Federation (TAF), the group I belong to, which bears the distinction of being one of the largest (if not THE largest) user groups in North America, with at

last count 300+ members. The last ACE show back in '92 was a great success (it was the debut of MultiTOS and - in a backroom for the dealers and developers - the first viewing of the Falcon), and we're hoping that the '95 edition will be just as good, if not better. Even with the number of Atari-specific businesses and software houses going down in the last number of years, we're getting a significant number of businesses, programmers, and user groups confirming that they're coming - and quite a buzz going on in the NA Atari community (which is nothing compared to the European community).

I'd love to see you all there - you too, Roger :)

S > More and more lies again, I have never refered to GFA any
S > where on the Net, so no more lies PLEASE...

guess what, Roger - I'm not lying at all. But you seem to have a very short (or selective) memory - I remember distinctly you saying a few months ago (on this very net) that "GFA Basic is Crap - and used mostly by teenagers".

Idealistic I may be. And I'm definitely not perfect - in fact, I could well be mistaken. But I am NOT a liar. Watch it with your false accusations.

S > If you are not happy with your Atari I do suguest you get a
S > Better computer, may be a Acorn, as being English I prefer to
S > recommend English computers..

How many times must I have to tell you, Roger - I'm PERFECTLY HAPPY WITH MY STe! I'm PERFECTLY HAPPY WITH MY STE!. It does what I need it to do, and that's enough! And ONE CANNOT BUY ACORN HARDWARE AND SOFTWARE IN NORTH AMERICA!

It's YOU who are NOT HAPPY with your ST - and you DON'T HAVE THE RIGHT TO MAKE US ALL MISERABLE ABOUT IT! Go and buy your bloody Acorn, sell your ST, and leave us alone!

S > But I thought all snotty nosed Teenagers use STOS....

Again, you're being totally unfair to something you don't personally like - like teenagers and STOS. Nothing like a computer language bigot......

... You sick little monkey! - Ren

You're right about Roger taking his anti-Atari stuff to advocacy. It has no place in this conference, which is supposed to HELP other Atarians - not tear them down. I have nothing against constructive criticism here (and indeed we all have a beef with Atari Corporation's lackadaisical attitude towards their computers) - but I have something against rude behavior, wrong facts, and computer-baiting. Roger makes Ralph Mariano look like Miss Manners :)

On a lighter note, it looks like the Atari Computer Exposition (ACE) '95 show in Toronto, Ontario, Canada (April 1st and 2nd - no, this is NOT an April Fool's joke!) is going to be a real corker - word is System Solutions may be coming here with hardware (it's not been confirmed yet). Atari HAS CONFIRMED they're coming, and they may have a very positive surprise for us as well.

ACE is being put on by the Toronto Atari Federation (TAF), the group I belong to, which bears the distinction of being one of the largest (if not THE largest) user groups in North America, with at

last count 300+ members. The last ACE show back in '92 was a great success (it was the debut of MultiTOS and - in a backroom for the dealers and developers - the first viewing of the Falcon), and we're hoping that the '95 edition will be just as good, if not better. Even with the number of Atari-specific businesses and software houses going down in the last number of years, we're getting a significant number of businesses, programmers, and user groups confirming that they're coming - and quite a buzz going on in the NA Atari community (which is nothing compared to the European community).

I'd love to see you all there - you too, Roger :)

me > love to hear

V > To be fair to Roger, he has helped HENSA's Atari section by
V > uploading quite a few pieces of software from Genie. Thanks
V > Roger.

Now if only Roger told me that, rather than to ignore my questions and heap abuse upon me (like calling me a liar in this conference) and my choice of a computer. Seems he's done SOME good for the Atari community at large - and I commend him for that.

V > As for his 'carping, whining," etc, he is entitled to his own
V > opinions...and from what I gathered, he is just complaining as
V > we all usually do privately, about Atari not upgrading their
V > machines...no support whatsoever. OK, I do admit though, that
V > most of this stuff should be in advocacy...so Rog, please take
V > most (if not all) of your whines to thast conf.

Maybe so - but when those opinions are half-baked, mistaken, and just plain WRONG, one has the right to correct another without having to endure torrents of abuse and insults. I'd like to hear Roger say "I was WRONG" for once when he's corrected, rather than to be instead getting from him "you're a liar who hates your Atari and wants to shoot the messenger - and you're probably a snotty teenager who uses STOS".

You're right about Roger taking his anti-Atari stuff to advocacy. It has no place in this conference, which is supposed to HELP other Atarians - not tear them down. I have nothing against constructive criticism here (and indeed we all have a beef with Atari Corporation's lackadaisical attitude towards their computers) - but I have something against rude behavior, wrong facts, and computer-baiting. me > : Tell me, what have you done other than carp, whine, and
me > spread disinformation and abuse amongst us Atari users. I'd
me > love to hear

V > To be fair to Roger, he has helped HENSA's Atari section by
V > uploading quite a few pieces of software from Genie. Thanks
V > Roger.

Now if only Roger told me that, rather than to ignore my questions and heap abuse upon me (like calling me a liar in this conference) and my choice of a computer. Seems he's done SOME good for the Atari community at large - and I commend him for that.

V > As for his 'carping, whining," etc, he is entitled to his own
V > opinions...and from what I gathered, he is just complaining as
V > we all usually do privately, about Atari not upgrading their
V > machines...no support whatsoever. OK, I do admit though, that
V > most of this stuff should be in advocacy...so Rog, please take
V > most (if not all) of your whines to thast conf.

Maybe so - but when those opinions are half-baked, mistaken, and just plain WRONG, one has the right to correct another without having to endure torrents of abuse and insults. I'd like to hear Roger say "I was WRONG" for once when he's corrected, rather than to be instead getting from him "you're a liar who hates your Atari and wants to shoot the messenger - and you're probably a snotty teenager who uses STOS".

You're right about Roger taking his anti-Atari stuff to advocacy. It has no place in this conference, which is supposed to HELP other Atarians - not tear them down. I have nothing against constructive criticism here (and indeed we all have a beef with Atari Corporation's lackadaisical attitude towards their computers) - but I have something against rude behavior, wrong facts, and computer-baiting. Roger makes Ralph Mariano look like Miss Manners :)

On a lighter note, it looks like the Atari Computer Exposition (ACE) '95 show in Toronto, Ontario, Canada (April 1st and 2nd - no, this is NOT an April Fool's joke!) is going to be a real corker - word is System Solutions may be coming here with hardware (it's not been confirmed yet). Atari HAS CONFIRMED they're coming, and they may have a very positive surprise for us as well.

ACE is being put on by the Toronto Atari Federation (TAF), the group I belong to, which bears the distinction of being one of the largest (if not THE largest) user groups in North America, with at

last count 300+ members. The last ACE show back in '92 was a great success (it was the debut of MultiTOS and - in a backroom for the dealers and developers - the first viewing of the Falcon), and we're hoping that the '95 edition will be just as good, if not better. Even with the number of Atari-specific businesses and software houses going down in the last number of years, we're getting a significant number of businesses, programmers, and user groups confirming that they're coming - and quite a buzz going on in the NA Atari community (which is nothing compared to the European community).

I'd love to see you all there - you too, Roger :)

S > More and more lies again, I have never refered to GFA any
S > where on the Net, so no more lies PLEASE...

guess what, Roger - I'm not lying at all. But you seem to have a very short (or selective) memory - I remember distinctly you saying a few months ago (on this very net) that "GFA Basic is Crap - and used mostly by teenagers".

Idealistic I may be. And I'm definitely not perfect - in fact, I could well be mistaken. But I am NOT a liar. Watch it with your false accusations.

S > If you are not happy with your Atari I do suguest you get a
S > Better computer, may be a Acorn, as being English I prefer to
S > recommend English computers..

How many times must I have to tell you, Roger - I'm PERFECTLY HAPPY WITH MY STe! I'm PERFECTLY HAPPY WITH MY STE!. It does what I need it to do, and that's enough! And ONE CANNOT BUY ACORN HARDWARE AND SOFTWARE IN NORTH AMERICA!

It's YOU who are NOT HAPPY with your ST - and you DON'T HAVE THE RIGHT TO MAKE US ALL MISERABLE ABOUT IT! Go and buy your bloody Acorn, sell your ST, and leave us alone!

S > But I thought all snotty nosed Teenagers use STOS....

Again, you're being totally unfair to something you don't personally like - like teenagers and STOS. Nothing like a computer language bigot......

... You sick little monkey! - Ren

You NEED a Falcon/Jaguar joypad. At least my 2 years old-nearly-finished-demo-version did. However, several games use this pad now : Moon Speeder, Super Bomberman (I haven't finished it yet, but a playable demo version is ftpable on ftp.cnam.fr , though it doesn't manage the joypads (the latest version does, however, but it's still at home, sorry ;)), and other upcoming games such as Aazohm Krypt (is it well written ? I doubt...)

Could you then try my demo of Super Bomberman (available on ftp.cnam.fr
)? It's NOT the last version, it still has minor bugs, corrected in the last version), but any
criticism (or compliment ;) is welcome...

The Medusa is a suped up TT. It's got a 64 MHz 68030 processor, and some other nice goodies. I belive it's built by Lexicor.

Remember to consider the software you want to run first before buying a computer. It's always best to determine what function you want your computer to serve and then taylor the configuration of that machine to your needs.

Later...

> HP's with a new logo and PS/Appletalk.

No - in this case, you have a software layer much like PostScript, only
not as complicated - HP's PCL Level 5. You can use RET on those printers
because the computer is sending vector data to the printer, too.

> Calamus SL offers color separation, Pantone colours, colour printing in any
> resolution - If you need it, there's a module for it.

I'm well aware of that.

> File sizes of eg. pages that are saved as 24-bit TIFF's are big, but there
> are always removable media - you need it for PS as well, as there are
> nearly always raster graphics with documents.

No argument with that, either. However, it should be obvious that, unless
the entire page is a raster image, a vectorized representation of the
portions that aren't raster image is much smaller than the equivalent
raster image, and resolution / printer independent to boot.

> >Calamus SL is nice if you can buy one of the high end output devices that

That's why PS files are often made with embedded fonts, to avoid font
substitution. I have no idea what you mean by "translating devices."

Consensus seems to be that SL's PS module is not that great. (Caveat:
haven't tried it myself.)

No idea, not having used QuarkXPress. However, I seriously doubt that it lacks the ability to position objects precisely. It, like Calamus, uses vector objects, so there's no reason why it shouldn't allow precise object placement. As for speed, that depends entirely on how good the respective programmers are, and the speed of the machines being used (obviously, Atari is seriously behind in that regard).

> So? If you print e. g. on a HP with RET, you have the same edge-finetuning as
> you've mentioned it. But this is entirely done by the printer (smaller or
> bigger pixels by manipulating the focus of the laserbeam).

HP's with RET use PCL Level 5 and/or PostScript. PCL L5 is a page-description language somewhat like PostScript; the printer takes care of vector object rasterization whether it is using PCL or PS.

> You can do that with Calamus as well. One big problem of PS are the different
> implementations in the printers. Not all models use the original Adobe-chip
> but a cheaper clone. That often causes all sorts of problems.

Actually, it's not an Adobe chip, but their software (PS is just a software program that runs on the printer's onboard processor). They have versions for all the major processors used in printer controllers, like the AMD 29000 series and Intel i960 series. And it is true that cheap clones sometimes cause problems - but since it's usually not much more expensive to get a printer with Adobe PostScript, that should not be a problem for most people.

> reduce the motivation for developers to do native ports and get a big
> speed boost.

Actually, nobody has anything but rumors that such a magic bullet emulator exists. And none of them are real conclusive about whether it's actually finished or not. (It can be real tough to release a new emulator for Apple; they have to make sure that it meets the same high compatability standards as the current emulator, even though it will probably be using an exotic dynamic recompilation technique. The current emulator operates on the traditional method of decoding a 68K instruction and calling the appropriate handler routine to execute it. It's damn fast for that kind of technique; I have immense admiration for the people who programmed that emulator.)

Furthermore, there seems to be no shortage of developers willing to port. The writing is obviously on the wall for 68K Macs, what with only one Quadra model left in production (a couple other 040 products in the Performa versions are also still being produced). I think there's at least an equal pressure on Apple to improve emulation, so that no real reason remains to stay on 68K Mac. (If they double current emulation performance, I'm pretty sure that *every* PowerMac model will outperform a 33 MHz Quadra in 68K performance. Native mode performance would also increase, because the OS is not completely native yet, and any increase in emulation speed thus speeds up the OS.)

> [As a further (unscientific) side note, my wife just replaced her 32 MHz
> Quadra 660 AV at work with a PowerMac 7100/66, and felt that the PowerMac
> was "somewhat slower", which tends to support Hutch's general theme.]

If and only if she runs non-native software. The instant you switch, the difference will be *quite* noticeable.

> You mention later that a PR of 1.0 is equal to a 25 MHz 68040, so I'm
> wondering how a 28% clock speed increase gave you a 53% performance
> boost?

The baseline machine used for the PR rating in Speedometer (a Quadra 605, I think) does not have as fast a memory subsystem as the Quadra 660AV (the

machine mentioned as being tested). Video performance on the 660AV/840AV machines is also better than any other Quadra, since those two machines represent the ultimate evolution of Quadra motherboard video.

Ah, uhm, I don't think your assumption on mid-rez is quite correct. BOTH lo-
and mid-rez have 200 lines.

And the refresh-rate is determined my the monitor's bandwidth.

x y rf hz px

640 x 400 w/71hz ~32khz x 640 ~20.5mhz bandwidth
640 x 200 w/50hz ~12khz x 640 ~ 7.7mhz bandwidth
640 x 200 w/60hz ~14khz x 640 ~ 8.9mhz bandwidth
320 x 200 w/50hz ~12khz x 320 ~ 3.8mhz bandwidth
320 x 200 w/60hz ~14khz x 320 ~ 4.5mhz bandwidth

x and y are quite obvious. rf=refresh. hz=horizontal frequency. px=pixelclock

>I had one SVGA monitor working fine on my ST, but haven't been so successful
>with my current one - partly because it won't sync down to 15kHz.

Which is perfectly ok. SVGA is 640 x 480 with 256 colors and 60hz refresh.
That makes hz ~ 33khz with px ~ 22mhz.

And a nice 1,024 x 768 with 75hz refresh would require a hz of roughly 64khz.
That's what makes those 17" so expensive.

Don't nail me with those figures. Real-world might differ. But esp. "hz"
should be a value to dertermine whether the monitor in question is able to
sync all ST frequencies.

358. TOS 1.0 on disk ?

Newsgroup: comp.sys.atari.st
Date: 1995-01-07 13:15:06 UTC
From: kevan@empyr.dircon.co.uk
Message-ID: <01071995.131506@empyr.dircon.co.uk>
Source record: 173533

Hi, does anyone know where I can get a copy of TOS 1.0 on disk ?

Reason: I'm having some software probs after recently upgrading from 1.0 to 1.4 and would like to try running 1.0 from disk to see if it sure the problems.

VQWK 6.20 [Rev H - 04/04/94]

Calamus SL sends the page as a TIFF-dump to my HPLJIIIP, and the curves get
still RET'ted. HPLJIIIP has also PCL-5, I don't know how many programs
actually use it.

>No argument with that, either. However, it should be obvious that, unless

Of course, but these days the matter of size is becoming less and less
important.

I mean eg. PS-printer's inbuilt program which translates PS to raster.
If you have older-level PS-printer, you get wrong output (or rather
no output at all).

Have you ever tried Mountain Reader II ?It the very best for all of
offline reading but it's not free or shareware. I think it cost about $30
or $40 but it supports everything you can think of including bluewave,
very user friendly and stable. I just paid for a copy and I'm waiting for
it to come in the any day now. You just can't beat it!

I have Flash 2.2 and everything is great!! You need to change your
charector codes to 8 bit instead of the 7 bit recomended, because it was for
calling atari supported bbs. Do this in the terminal menu, and make sure you
also have the terminal set to ansi and the IBM charector set selected in
the MORE TERMINAL OPTIONS selection at bottom of the terminal menu screen.

Good luck and mail me back to let me know things worked or if you need
more help. My e-mail address is below.

>Didn't I just read that Gadgets went under? How can one
>obtain this new version?

It's likely that, due to publishing lead times, the information in
the ad was based on _projected_ delivery dates, given before Gadgets
filed for bankruptcy. If Gadgets didn't ship it before they closed
down, then you can't get it...

365. Help NEEDED Hooking up NONatari MonoMonitor

Newsgroup: comp.sys.atari.st
Date: 1995-01-07 16:25:41 UTC
From: MARSALONE@news.delphi.com
Message-ID: <3emfa5$h6b@news2.delphi.com>
Source record: 173541

Hello, I have some monochrome monitors available to me.
I wish to hook one up to my ST instead of using that lame composite
cal. The only problem is that they are from IBMs. I dig that I'll
need to hack a cable. But what kind of monitor can I use...
Standard MDA monochrome, monochrome VGA, or what?????

I see that the ST cranks out 640x400 in mono mode. But what are
the Horiziontal and Vertical scanning frequencies required to display
mono??

Any help or directions to FAQs would be greatly appreciated.
Thanks.

366. What are the HI-RES scanning frequencies? for ST.

You're kidding, right? I've got a '486dx2/66 at work with 16M of RAM,
OS/2, and a local-bus video card, and it can barely play MPEGs at a
reasonable speed.

Good luck doing it on an ST; even a TT would have problems. A Falcon
could pull it off, but only if it used the DSP.

The Atari Community E-mail Address Book
Revised 7-Jan-95

Hello all! This list has been compiled to provide Atarians worldwide with the addresses to contact other members of our ever-changing Atari community. The first half of this list is user groups. For those groups with multiple e-mail addresses, the first is usually the primary contact. The second half of this list is significant members of the Atari community.

If you have any changes, additions, or suggestions, please contact me via private e-mail. My addresses are listed under AUNT.

Dan Mazurowski, AKA Sir Smedley
Semi-official e-mail contact for AUNT

PS - This list may be printed and distributed at will, though I would like credit for compiling it. Please be sure to contact me for the latest update, as I won't post every minor change.

>another go.

No,no !! Never use contact spray in mains switches!
The solvents and chemichals are highly flammable, even when it seems to
have dried up it is still flammable. So for high voltage (mains) switching
stuff, NEVER use contact sprays !!
If you can take the switch apart, you may have some luck with a glassfiber
pen to clean the contacts, otherwise just replace the switch.
Believe me, I know, I've seen lot's of nearly burned out TV sets in which
the owner tried a contact spray in the mains switch....
For low voltage OK, but for mains, never.

Gert

Unfortunately, you're overlooking one other problem... all of the
developers are gone. Who'd recompile Atari apps to be PowerPC-native?
I'll bet the source code for things like WordWriter II and other older
Atari apps have disappeared.

Newer apps like Papyrus could be recompiled, but who'd be buying the
systems?

>If you can argue any of these points, please go ahead, show your
>ignorance again.

Untrue. While much responsibility resides with the programmer, if a language
developer creates a language where the standard memory handling routines
were all illegal and broke under MTOS, who is to blame?

If a programming language has graphics routines that only work in ST-Low
resolution, who is to blame when they break on a Falcon?

A person developing a compiler shoudl have as their goal creation fo standard,
universal programs for the platform they are developing on. Just is one should
excpect from programmers developing applications in C, which has the power to
allow users to develop poor or good programs, depending on the library.

~Chris

(p.s. my "examples" were not meant in any way to be related to any particular
programming language. They were simply the first 2 things I coud think of)

> actually use it.

The Apple printer does this too. However, it doesn't always produce great results, since when it tries to smooth a bitmap image, it doesn't have the best information on what the curves should be. That's the point - to get the best smoothing / resolution enhancement, the pritner needs to be sent vector data, so that the enhancements it performs are guaranteed to be correct. You're taking a chance when sending it raster data that the edge detection algorithms work well enough to produce good results.

> I mean eg. PS-printer's inbuilt program which translates PS to raster.
> If you have older-level PS-printer, you get wrong output (or rather
> no output at all).

Just as a PCL level 3 printer like the DeskJet 500 cannot print PCL level 5 graphics. In both cases the solution is to use a lower level driver or change the driver settings to match the printer being used.

One interesting thing is NeXT: it uses Display PostScript as the screen imaging model, and PostScript as the printing model. That means that printing is very simple for the programmer: you just send PS data to the printer instead of the screen.

I have some ST software for sale:
All are original and come with the box.

Populous II $20
Bard's Tale $5
Dragons of Flame $5
STOS $15
Power Pack (TV Sports football, Lombard Rally,
Bloodwych, forgot title -- a good shooter
game by the Bitmap Brothers $15

STalker 3.0 + Steno $15
NeoDesk 3.0 $10

3 years+ worth STInformer (1991-1993) $10

2 years
worth of STart + disks $20

Make me a bundle offer.

Thanks!

I'm very surprised he's still around. Wasn't it him who had a disagreement
with Atari about some software for Geniew (out of my depth here).

He was also promising in March 93 this release for June of the same year
IIRC.

>Programmers produce "Crappy" programs, not programming languages.

GFA does due to the compiler bugs. Thus your claim is false.

>There are ways to right ANY program to make it crash on any system
>other than the one it was intended for.

In GFA one only has to run it through the compiler to produce code that
crashes.

>Besides, look at how many
>games will not work on the TT or the Falcon or even an STe. Does this
>mean they were writing in a BASIC language ?

It means they are crap.

And I can name several
>(if not lots) of very good programs that may not run with Multi-Tos
>or Speedo or Geneva or Magic.

I can't name one. A program (besides games or demos) that doesn't run on
any Atari compatible platform is either suffering from a fixable bug or
indeed crap.

>If you can argue any of these points, please go ahead, show your
>ignorance again.

Please run any _correct_ GEM program's source code through the GFA
compiler. It will crash on several machines. You have to work around the
compiler bugs to make it run. Proof: the UUCICO in GFA, current version by
Ole Marienhagen. I know the programmer _personally_ and _he_ knows the
problems with GFA.

> that this compiler must be welcome news. While the pseudo-compiler they

It is. Though it has still some bugs. (Sometimes, the cursor is placed
wrong, menu bars in graphics mode sometimes stay on screen, etc. Will be
fixed with the next release.)

> previously used (much like Visual Basic's) compiled source into .exe's,

It is as good as GFA for Windows. Some parts of programs run even faster.
But the programs compiled with GFA-DOS are slightly longer than those
compiled with GFA-WIN.

>

387. Re: Space-Panic '94

Newsgroup: comp.sys.atari.st
Date: 1995-01-08 04:48:25 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <3enqqp$bdo@charm.magnus.acs.ohio-state.edu>
Source record: 173438

Ok. Revision B is now on atari.archive.umich.edu under
Games/Space/p94_revb.zip. It is only the binary and about 73k. If you want
the sounds and graphics before next week, you will need to get panic94a.zip as
well, but pitch it's binary, since it only works on the Falcon.

Well I found the bug today, I had a typo in a test which inadvertently
sent Falcon specific calls to any machine with DMA sound. That's now fixed. I
also fixed it so that it runs on machines without DMA sound. I was actually
amazed at how well it ran on my 1040 STF.

So please try it out and let me know what you think. And if you still
have problems (I hope there are none) with rev. b please let me know so I can
get rid of them.

Rev. b has been tested on the following machines, which while not fully
inclusive of the entire spectrum, give me hope that it should run on about anyu
setup. 1040 STF with TOS 1.0, 1040 STe (TOS 1.62 and 4 megs) and my Falcon
with TOS 4.02 and MTOS.

Sorry again about the problems, and hopefully I've gotten them all out.
Please send me your ideas, complaints, opinions, etc.

From: kfason@csn.net
Message-ID: <3eo0fi$1es@news-2.csn.net>
Source record: 173442

Anyone out there running a BBS on a Mega/STe and are using Modem2? A friend has one and is running RatSoft. the only catch is that the Modem2 is a problem. here it is.

WHen a call comes in, RatSoft picks up (v2.1a, latest), but after the connect, it switches to 4800. If my friend goes to the control panel and changes from 4800 back to 38400 (or 57600) things work fine and the BBS is cool. The author of Ratsoft (steve I recall) has made a version specially for this BBS with all the port stuff removed, it still does it.

We've tried various combos of HSMODEM (4), FSER, etc... but no luck. any help is appreciated! with auto programs, etc... On the control panel changes, they where done with Fser .96, some of our other responses are no pickup, to pickup and nothing but garbage being sent (same speed apparently...)

The Mega/STE has TOS 2.06. I know the Modem2 (all ports actually) work fine as it used to be MY machine, and using STalker or Connect, it works fine if the Mega/STE picks up the line in those two programs. Steve says that he is using legit calls that he got from atari...

thank you! any help is VASTLY appreciated. The BBS (Ringworld 303-699-0402) has 1.5gigs online AND 3 CD-ROMS, it is mostly Atari, so you can see why we would like it to get going at greater then 19200...

A Falcon can pull it off: try PlayMpeg 0.68 or MpegDSP, they're both
shareware and use DSP. 1STguide, which works on every Atari, is
faster when you do configure it to not use any dithering, but it's
still not fast enought.

r > upgrade path is availabe between the two? Any other
r > advice/information?

I haven't tried Emagic Micro Logic, though I'm sure it's fine.
Howewver, I have got both Logic Audio and Cubase Audio for F030.
So this is some "future advice" when you get to buying "the big one"
I may be biased since I've worked a lot more with CAF and have also
beta tested it during -94, but I think Cubase Audio quite objectively
has more features and is more advanced than Logic Audio.
The examplesare many including:
8 *or 16* Audio Tracks (through data compression)
EQ for seperate tracks in Audio Mixermap (3 band cue shiftable)
Offline Processing Window with Sample Rate Conversion,
Reverse,Dither, mono-stereo conv and a number of other processing
possibilities.
FA8 (Falcon Analog Eight out) support in Mixermaps, with a 4X2 bus
system for sending the 8 (or 16) audio tracks to the 8 outputs on
the FA8 in a number of fashions.
etc...
I'm not saying you shouldn't buy Logic Audio, but it's quite obvious
that Charle Steinberg and his collegues at Steinberg spent more
energy at developing Cubase Audio. Once again I'm not putting Logic
Audio down. My advice : just check it out....
There's also a "Cubase Light" wich is a mini-version of Cubase.

: > How can we carry the Atari computer to the future. The Atari computer
: > has left a major dent in the music industry.

Yes, but that dent is slowley getting smaller. My own view is that
not only will Atari have to develop a decent machine but ALSO and this
is the essential bit a decent suite of software to go along with it.
Some of which should come supplied and others are extra these packages
at the very least should include:
good MIDI software
a fully feature DTP/Wordprocessor
Internet access software e.g mosaic.
A range of about 12-15 high class games.

For a start good hardware is essential, but if there is no software
to go along with it, it will go nowhere. A typical example of this
was about 10 years ago here in the UK. At the time several small
computer companies were launching new products. At the end of the
day the only ones that survived were those with a range of cheap
and easy to buy software, or those that were launched with a free
bundle and plenty of extra software to buy (e.g Amstrad CPC).

The Falcon could have had an excellent start if Atari had perhaps
indicated they had invested in software. Atari Works is apprently
very nice, but when you look at whats available on the PC's you being
to realise just how primative it looks and is.

: I am fortunate enough to have gotten a 14Mb Atari Falcon (one of the early
: development machines) for very little money. Now, rather than selling it
: and making vast amounts of profit, I am considering keeping it.

: I use my Amiga A4000 (boo hiss!) to produce graphics for Raves.
: What uses could I put the Falcon to?

: Can it produce a full Video Overscan picture? (736*566 or better)
: In how many colours?

From what I gather (but I could be totally wrong) the Falcons Graphics
Hardware is fully programmable. The only problems arise with the types
of monitor you are using. There is a program called overscan, which
I believe increases screen size.

: Anything else you can think of that might be of use?

Apex Media (haven't seen it myself though) this is a multi-media/
graphics package and looks simply STUNNING. It has true colour
manipulation, a is apparently VERY fast, and runs excellently
with 14mb of RAM. Price well only #119.

All I can say is you lucky git. Just one thing though check which
version of TOS it has. If it is less than 4.04 upgrade it NOW!!
I don't have the cash to do this to mine at the moment, but as soon
as I do, it will be done.

j>
I just started to try KIVI, and the way it is designed is just what I
was looking for... BUT ... the 'selection bar' does not move its screen
position when going from one screen to another [ie there are 100 messages in
base 10, and I read message#29 out of the 40 listed on my 19" monitor. when
I shift to the next screen of selections, the bar is still in the same
position on the screen, selecting #69, instead of looping to the top for
#41.]. There may be more, but that other than that it looks GOOD ;^).
BTW, thanks to sysop Brian Seburn for FTPing it for me !!!

It is correct, in a digital RGB monitor the input colours are either on or
off, whereas analogue inputs are continuously variable.

Rod McCall (rmccall@mcs.dundee.ac.uk) wrote:

: Does anyone know of autility for UNIX machines which will remove atari
: control characters. E.g "^M"

If you have mtools (a utility for reading/writing MS-DOS disks)
than all you need do is to save your text files or whatever on an MS-DOS
formatted disk and use the -t flag (which will strip that annoying ^M)

Ex:

$ mcopy -t a:\myfile.txt myfile.txt

Another solution is to pull the document into vi and issue this command:

:%s/^V^M//g

Where ^V is control-V and ^M is control-M. That will do a search an
replace for ^M characters (^V is vi's literal escape character, kind of
like a backslash) and replace them with nothing.

(Credit for the vi solution goes to Nathan Urban (nurban@vt.edu))

There's a nice GEM-program for *Atari*, which does all sorts of
text-filtering (Mac,PC,UNIX -linefeed conversions, remove ASCII 1-32...)
called BLINEX. It comes with IdeaList 3.5 (utilities).

I just posted an article on c.s.a.announce about the immediate
availablity of what I hope will be the last beta release of
MGIF 4.4.

If you don't want to wait to read that article, the archive can be
fetched from my ftp site, rand.thn.htu.se, as /pub/mgif/mgif0108.lzh.

Please, do not make this beta version available anywhere else.

For those of you who haven't heard about MGIF or believe it's just
another mono GIF viewer, I suggest looking in c.s.a.a.

There's really no "official" name for the new BBS/upgrade. I guess that
"MBBS upgrade" will have to suffice. I just wanted to clarify that it
wasn't a MichTron effort. <g>

>I'm very surprised he's still around. Wasn't it him who had a disagreement
>with Atari about some software for Geniew (out of my depth here).

Yes, Tim is still around on GEnie, but not always as visible (or responsive)
as we'd all like. I don't recall his having any disagreement with Atari
with regard to GemView, though.

I don't really have any experience with host mode. I think it's the same
but you set the modem for auto answer:

at s0=2 where 2=number of rings before answering(1-255)

428. PLAYMPEG Version 0.70 Released

Newsgroup: comp.sys.atari.st
Date: 1995-01-08 22:31:16 UTC
From: mdg@ukc.ac.uk
Message-ID: <526@stork.ukc.ac.uk>
Source record: 173377
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Version 0.70 of my shareware Falcon MPEG player is now available via FTP at

ftp.uni-kl.de
atari.archive.umich.edu etc.

This version now plays MPEGs direct from disk with almost no performance loss.
Details on how to register accompany the program.

>I have a 520 ST that has faulty mouse/joystick ports.
>I have tried changing the keyboard processor with a good one
>from my 1040 but no luck. Instead I just swaped keyboards, and
>there was no problem.

This is a normal fault with all ST Keyboards, dismantle keyboard
and resolder the conectors, first hold these conector hard onto the PC
board...

One way to stop the problem is to use those 8"/ 20cm extention cables...

Be carefull with the rubber cups when opening up the keyboard, the Return
key only has one cup....

when reassembling be carefull with the Power and Drive Leds, also make a
1"/10mm frame to support the keyboard when replacing the back PCB, it is very
easy to get the keboard bent, also fit all screws loose at first then tighten
them from the centre outwords, like tighten center screw then one of each side,
then go to the next set of screws, etc...

436. Falcon GFX-cards

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 01:52:54 UTC
From: root@icon.pp.se
Message-ID: <H.ekBL.AMN4zSY9riY@icon.pp.se>
Source record: 173385

Does anyone know if there are/will be any gfx-cards for the Falcon. I`ve already got a "gfx-accelerator" (Screen Switch Box), but I`m looking for something better, something that doesn`t consume every inch of bandwidth in high resolutions and that could handle f.e. 1280*1024(NI) in 16 or 256 colours. Since I`ve ordered the Barracuda accelerator (which once again has been delayed - now till the end of February) the card must be able to work together with the Barracuda. Is Wizztronics(sp?) planning any graphics-card especially for the Barracuda?

Any info appreciated!

437. Second serial port on Falcon

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 01:59:42 UTC
From: root@icon.pp.se
Message-ID: <H.ekBL.hedU&mgBcwI@icon.pp.se>
Source record: 173386

I`m about to modify my Falcon to get a second serial port by using
the built-in but not used MFP. I know that there`s a description
in the HSMODA-package on how to do it, but I don`t trust my german
when it comes to soldering inside my Falcon. ;-)

So my questions are: Has anyone one the net tried this? Was it easy?
Does it work well?

Thanks in advance!

438. What models/types of Atari ST computers?

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 03:14:19 UTC
From: static@amiserv.xnet.com
Message-ID: <3eq9mb$sme@flood.xnet.com>
Source record: 173388

I'm interested in buying an Atari ST computer. I'd like to get whichever machine was at the high-end of the line. The ones that I know of are:

Atari 520 ST
Atari 1040 ST
Atari Mega ST ?

Are there any others?
What I really need are the technical specifications of these machines, is there an ATARI ST FAQ that has this information?

Please send replys via email or post a followup to this message.

Thanks

Martin:

Many thanks for making that available!

I don't have a Falcon (I have a MegaSTe), but I'm going to get your
program for the local Atari dealer who does have a Falcon. Perhaps he
can use it to "show off" the Falcon to prospective buyers.

Last year two people -- independently of one another -- from Las Vegas
walked in off the street, never having been previous customers of his,
and bought Falcons. They each said they were buying them to do
development work for the Jaguar(!)

Again, thanks for supporting the ever-dwindling number of Atarians, even
in these "dark" times.

The original was Chroma, but the authors had a "falling out" and
development was (after much hassle) continued by the current team, with
a new name (to remove legal hassles from the original authors), and
a fair chunk of rewrite. And, almost a year after it's original
hoped-for-release date, Chroma is now available as Apex Media.

>Any info appreciated!

At the recent ProTOS convention in Germany, there was a product shown that
would increase the clock speed of the existing CPU in the Falcon to 40 MHz and
also boosted the speed of the bus (by how much I'm not sure) which gives the
Falcon enough ooomph to get 640X480 in Truecolour, at 70Hz refresh rate. That
was the only claim that I read about the item, but I suspect that it would be
able to increase 16 and 256 colour resolution similarly.
I don't know for sure but I highly doubt that it would work with the
Barracuda. I do know though that Wiztronics is working on a related product
that will be a killer video digitiser/genlock/mixer etc... and I would guess
that it would have pumped up video to accompany it as well.
Incidentally, I have Screenblaster II and I quite like it. It doesn't
seem to slow down my machine much, if at all.
Hope this is useful. >:)

Christopher Taylor Oates (aspect@cats.ucsc.edu) wrote:

: Untrue. While much responsibility resides with the programmer, if a language
: developer creates a language where the standard memory handling routines
: were all illegal and broke under MTOS, who is to blame?

It is up to the programmer to choose _not_ to use those routines.
Assembly programmers have full access to Supervisor mode functions and LineA
exceptions; does this make assembly language crap because some users choose
to use them?

: If a programming language has graphics routines that only work in ST-Low
: resolution, who is to blame when they break on a Falcon?

Again, it is up to the user to determine the screen resolution and switch
accordingly -- as well as saving the registers before the change so that it
can restore them at program's exit. it is not the responsibility of the
language to do this.

: A person developing a compiler shoudl have as their goal creation fo standard,
: universal programs for the platform they are developing on. Just is one should
: excpect from programmers developing applications in C, which has the power to
: allow users to develop poor or good programs, depending on the library.

So you advocate the development of code to be totally universal and portable
and therefore appealing to the lowest common denominator? I for one
subscribe devoutly to the "Machine specific school of programming". Because
I feel that if I'm going to write a program on a particular machine< I want
to take as _much_ advantage of _that_ machine as I can. No wasted address
space, as it were. I absolutely can't stand lowest-common-denominator ports
because they are invariably written to appeal to that end, and not to take
advantage of higher end machines which are more powerful. Any program I
write is going to be written generally for _this_ line of computers, not any
other, so that I can better take advantage of _this_ line of computers and
make the best use that I am able of the facilities that this line affords
me. If I want to port it, I will rewrite it for the other platform to take
advantage of _its_ capabilities. It might take longer, but the end product
is smething which is optimized for the respective machine it was written
for. Anything less, I feel, is utterly lazy and reprehensible.

: ~Chris

: (p.s. my "examples" were not meant in any way to be related to any particular
: programming language. They were simply the first 2 things I coud think of)

Hi.

I always used 2 utilities that were on "my" UNIX server, called:
unix2dos, and
dos2unix.

These worked fine for me, and are probably on your server already (I hope!)
Otherwise, just telnet to an archie site - e.g. archie.au and do a
find unix2dos
and it should tell you where you can get it.

Hope this helps!

It is interesting that it is now more viable to run ST programs on a
real Macintosh than vice-versa.

>was the only claim that I read about the item, but I suspect that it would be
>able to increase 16 and 256 colour resolution similarly.

What you are describing is the SpeedResolutionCard. It gives you a 20MHz
bus (instead of the original 16MHz) and makes it possible to feed the VIDEL
with a fully adjustable clock (instead of 25 and 32MHz which you normally
can choose from). Most VIDELs can handle clockrates up to ~55MHz, which
makes for a quite nice improvement in graphics. Unfortunately the higher
pixelclock also increases the load on the bus making the computer slower
the higher resolution and the more colours you use.

>I don't know for sure but I highly doubt that it would work with the
>Barracuda.

Even if it works I don`t want it. I`ve already got ResolutionSwitchBox which
uses the same technique as SpeedRezCard to improve the graphics. What
I`m looking for is a "normal" gfx-card that has it`s own graphics engine
and vram and that feeds my monitor with a high-quality signal.

>I do know though that Wiztronics is working on a related product
>that will be a killer video digitiser/genlock/mixer etc... and I would guess
>that it would have pumped up video to accompany it as well.

Sounds good - and VERY expensive. :-)

>Incidentally, I have Screenblaster II and I quite like it. It doesn't
>seem to slow down my machine much, if at all.

The slowdown depends mainly on how much data needs to be shuffled across
the bus to update the screen. 640*480 in 16 colours means 150KB of data
each time (9MB/s @ 60Hz). 1024*768 in 16 colours means 384KB of data
each time (23.04MB/s @ 60Hz). I don`t know how much bandwidth the Falcon
has, but I`m sure 23MB/s across the bus makes the machine rather slow.

453. 1 Gb Harddisk problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 09:38:22 UTC
From: esustron@eduserv.rug.ac.be
Message-ID: <3er06e$53f@infoserv.rug.ac.be>
Source record: 173303

Recently I bought myself an HP C2332A/101/300 1Gb SCSI2 harddisk for
my ST. It has a jumper that should make it respond like a SCSI1. It works on
a PC, a Mac, a Falcon, but *NOT* on my ST. I've tried it with the ICD-Link
and another host adapter, but the result is always the same: the green LED
starts flashing the moment my ST tries to address it, and the ST doesn't
seem to notice there is a drive on the SCSI-bus. I've tried different
harddisk utilities, but nothing seems to work.
Since the thing costed me a lost of money, I really should get it to
work properly. Can anybody help me?

So you reckon you know enough about PS to criticise it, yet don't even know
the difference between PS and EPS?

There is no font problem anyway if you get your package to include the fonts
in the PS file. That's what I do with PageStream.

Sprite Works will let you play sampled sound on interrupt, but I'm not
entirely sure if it's compatible with v2.0 (it's fine on v3.x).

>allow xwindows to be piped to the st over the serial link?

Yes - there are two.

One was a comercial system from germany (I know this supported ethernet, not sure about serial). I don't know if this is still available, but it was ridiculously expensive (about 400 pounds (sterling)).

The other option is free, but not easy to set up. You first have to install MiNT. Then you need to install minixXFS. Then get mint-net & install that. Then you can install X11R5 for mint & run your atari as an Xterminal over a proper slip connection. You've got no chance on a 1Meg machine though, it needs 4Meg.

There is a utility called 'dos2unix' which should convert the atari format (Dos)
to unix.
There is also a utility called 'flip' (not sure if its PD) which does essentially
the same thing.

The peopole learns about using this *entirely* _different_ but how
POWERFULL architecture, so the beginings are dificult. But in some 10
years who will use any x86 or even 68k?

> The 68k-series used in MAC's and Atari's are compatible on the cpu-part. The

> can be worked around, using OS-calls properly.

So, as I said its the time for learning the new quality of programming
art. You have to use all of advantages of RICS and other new solutions in
low level, but in other side, even most important, you have to learn to
use OS-calls properly and _only_ in high level.

> compatible to PPC-Linux as well.

So its the best moment to get into PPC. Later it will be the same
situation as it is with Linux on Atari now. And 'old fashioned' companies
with 'old fashioned' CPU's on their boards doesn't have any chances in
the future. BTW please wait a minute (I mean year or two max.) for
quite a lot of applications running on PPC and getting powerful on new
versions of this chip. However if not PPC, there are few oter companies
(DEC, SIG..) trying to sell their (huge - yesterday) systems as desktop

platforms, and I'm *really* SURE, that there will be no place for all
that mass (x85,(9), 68k, ...) in the future.

regards,

Simon.

>being developed?

Yes, Apex media is an excellent 2d animation/morphing/photo retouching package that will use the DSP as a slave processor yielding speed comparable to a pentium, and in the same order of magnitude as an SGI! Available right now from Lexicor for U.S. $199.00. Lexicor also distributes several other video and animation packages, most notably Chronos 3D (a 3D keyframe animation package which now works on the Falcon, and Phoenix 2 (3D rendering program that can render Chronos animations with surface textures).
Overlay from COMPO is a video titling package with lots more promised, I don't know what the price or availability is, but I'm guessing it will be available soon. Contact compo@genie.geis.com for complete details.
InShape is a superior ray-tracing/animation package that is being distributed in north america by Cybercube. I own this package and can highly recomend it. The interface is currently best suited to tasks such as Architectural rendering and walk-throughs, or engineering mock-ups. Things like showing the inner workings of a clock or the cycle of a 4 stroke engine are an absolute breeze. However more "organic" things like animating dinosaur combat (for example >:)) aren't quite as easy. The output from InShape is breathtaking.
There are several others under development (InShape 2 comes immediately to mind) including a 'toaster' like hardware deal called the "Video Funnel" which is being developed by Wizztronics (also developing the Barracuda 040 Falcon accelerator) and software for video editing use on it. The ones I listed are just the ones that I either own (InShape and Chronos) or am thinking about owning (Apex, mainly.)

>3. Are there any Atari or Atari Falcon listservs?
>4. Any info on the TOS replacement Magic? Will this mean that we can run
>TOS on a PPC?

All I know about MagiC is that it offers true preemptive multitasking (like MultiTOS) but is much faster than MultiTOS or even SingleTOS! It is also faster than Geneva, but not as pretty. Currently it isn't written for PPC, but it is available for either Atari hardware or Macintosh '030 and '040 machines.

I assume (but can't be sure) that it will work on Medusas and Eagles too. I'm thinking about buying it, but I am mostly content with MultiTOS 1.12.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Dear All,

I am interested in obtaining a Spectre GCR unit, in fact I am interested in obtaining a number of the older Mac emulators for the ST (preferably in the UK but I might consider paying US shipping), mainly for nostalgia, as they started me on the way of Macintosh.

I am also looking for info on one of the greatest ST hackers of all time Dave Small, does anyone know what has happened to Gadgets by Small ?

I look forward to your reply

Regards

Julian

Oh, I see. I haven't heard about any 'normal' gfx-cards. I'm fairly content with the existing graphics capabilities of my ScreenBlaster II equipped Falcon currently, but I admit being tempted by an 80 column truecolour. When you install your Barracuda, wouldn't your entire Falcon motherboard just become a graphics and I/O board? The Barracuda would become the new "motherboard" since it has the CPU, the RAM and even has a faster DSP on it now (so I've heard...)

I think they were aiming for U.S. $900.00. That's a little pricey for a graphics card, but that's an excellent price for a video studio! Best to ask Steve at Wizztronics (although he's *really* busy with the development end of things right now.) I think Brad Korda of Best Electronics might know something too. (Sorry, I don't have either email address here.)

That would seem to make sense, but I haven't really noticed any slow down. I mostly run in 800X608 in 16 or 256 colours, which wouldn't be as demanding as 1024X768, but even when I switch up to 1280X960 in 16 colours I don't really notice a slowdown. Let me know where I can find a good benchmarking programme and I'll run some tests. >:)

I have an 85Mb partition, drive H, which I have recently converted to a
Minixfs partition. It seems to work fine, except for one small prob -
When I run fsck on it is says

"Unable to sync or lock device H:."

It doesn't discover any errors in the filesystem if I tell it to continue,
but I am a little concerned as to the security of the files...
Can anyone explain what this message means and whether I should be getting it?

I am running a 4Mb Falcon with TOS 4.01, Mint 1.12, Mint-os 1.4.1 and minixfs
v0.60.

: mean they were writing in a BASIC language ? And I can name several
: (if not lots) of very good programs that may not run with Multi-Tos
: or Speedo or Geneva or Magic.
: If you can argue any of these points, please go ahead, show your
: ignorance again.

First of all, I would like to say that I have programmed in GFA Basic, several other dialects of BASIC, C, C++, Modula-2, Pascal, and a little bit of LISP and some other obscure things, most of these being on the Atari as well as on other machines, so I shouldn't be too biased towards a particular language.

GFA-compiled code does do some dodgy things, no matter how it's written. As in games programs, this was done for a good reason at the time - speed. Unfortunately, after support for GFA Basic ceased, the various OSs that are run on the Atari moved on and GFA didn't, meaning that various assumptions and techniques that the GFA authors made no longer held. I believe many of these can be worked around, but it still isn't ideal.

The major problem I always encountered with GFA was its lack of support for structures. These are normally used a great deal in GEM programming, both for accessing the OS and implementing data structures such as linked lists and binary trees within the application without which allowing unlimited open windows and other features present in modern GEM applications is difficult.

ATB,

Martin

There is a 'normal' Falcon gfx-card, from Hard&Soft. It costs about 800.-DM with
1 Meg and about 1000 DM with 2 Meg Memory. It should be available now. OK, thats
all i know about this card, so don't ask me more. It is *very* new, so we will
probably see some reviews within the next month.

I wouldn`t mind that either, but what I`m really looking for is something to give me 1280*1024 @ 16 or 256 colours with a high-quality signal. I`ve got a pretty nice 17" MAG monitor with Trinitron-tube, and the lousy signal (and poor resolution) produced by my current hardware doesn`t really make my monitor-investment worth the money. As things are now I could just as well have bought an old 14" monitor with phosfor-problems. ;-)

> it now (so I've heard...)

I`m not sure. My guess is that they just feed the original DSP with a new clock making it go faster. Also, before I can afford a RAM-card I will have to use the ST-ram that I already have. It`s a shame they don`t include at least 4 SIMM-sockets on Barracuda. Having to buy an expensive card just to be able to add some alternate RAM when you just paid ~1150USD for the accelerator is insane.

BTW, does anyone know if it will be possible to switch back to 68030-mode for compatiblity?

I agree. The point is not that it is _impossible_ to produce good programs
in GFA, but that if you want to, you have to fight the compiler at every
stage. That's not the mark of a good compiler.

Message-ID: <511_9501100913@clipper.de>
Source record: 173254

I have an 85Mb partition, drive H, which I have recently converted to a
Minixfs partition. It seems to work fine, except for one small prob -
When I run fsck on it is says

"Unable to sync or lock device H:."

It doesn't discover any errors in the filesystem if I tell it to continue,
but I am a little concerned as to the security of the files...
Can anyone explain what this message means and whether I should be getting it?

I am running a 4Mb Falcon with TOS 4.01, Mint 1.12, Mint-os 1.4.1 and minixfs
v0.60.

479. [Q] Linux on 1040 STe

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 13:42:24 UTC
From: k3086e1@wildsau.idv.uni-linz.ac.at
Message-ID: <3ereg0$m9i@alijku06.edvz.uni-linz.ac.at>
Source record: 173323

A few months ago I wanted to get the linux version for the Atari in order to
install it on my 1040 STe. But from reading the <<Readme>> files in the
folder I assumed that it is not possible to install Linux on an 1040 STe
Is it?
If not I want to connect my Atari to my Linux-PC to have a second terminal.
I already have managed to do so but what I would need now is an ftp-site or
something the like, where I can get Terminal programms (I need a VT220 for
Linux, don't I)

Thank you for pointing me into the correct direction

P.S: Please e-mail me directly, because I have not enough time to read this
newsgroup regularily

:version 4. Is that still avaiable? How expensive, and where?
:As an alternative, I saw an advert for Riemann II in some mag, but
:that was a few years ago. It had an interesting Student Rebate.
:
:Any info on this?

I do not know Riemann II, but what about Reduce or Euler?
I have both of them. I picked up Euler from some ftp site, but did not
work with it a lot, as 1Mb RAM is tight for this kind of applications.
I can send it to you if you can't find it on ftp sites.

490. [Q] Linux on 1040 STe

Newsgroup: comp.sys.atari.st
Date: 1995-01-09 14:42:24 UTC
From: Robert.Lichtenberger@p55.f5500.n240.z2.fidonet.org
Message-ID: <50d_9501100913@clipper.de>
Source record: 173264

A few months ago I wanted to get the linux version for the Atari in order to
install it on my 1040 STe. But from reading the <<Readme>> files in the
folder I assumed that it is not possible to install Linux on an 1040 STe
Is it?
If not I want to connect my Atari to my Linux-PC to have a second terminal.
I already have managed to do so but what I would need now is an ftp-site or
something the like, where I can get Terminal programms (I need a VT220 for
Linux, don't I)

Thank you for pointing me into the correct direction

P.S: Please e-mail me directly, because I have not enough time to read this
newsgroup regularily

STR has been bought out by the publishers of ST Format, pearsons. You
will now be getting ST Format with a little banner on the cover saying
"including ST Review".

Shame really. STR will be missed dearly.

>Careful, you be flamed about this being illegal now....

Not by me. Who really cares now? Doubtful even if Atari does anymore.

>At least get v1.2 anyway!OW :) 1.0 is horrible!

Actually, TOS 1.2 (the MegaST TOS) is no better than 1.0 as it retains most,
if not all, of the original quirks and bugs. 1.4 was the first -real- fix.

That's not correct. _All_ the newer monitors I've seen will handle down to
at least 31 kHz, some as low as 24 kHz. But none go low enough to handle
the ST color modes (low and medium).

> I don't have the exact ST-frequencies handy at the moment, sorry.

It's 71.2 Hz vertical, 35.7 kHz horizontal, at 1Vpp analog into 75 ohms.

> with my machine...Very nice work indeed!!!

Yes, it's a big improvement, even over Johan's recent betas. The GUI
enhancements are quite nice. I've only run into two problems so far:

(1) saved flicker files (.FL) are in inverse video!
(2) a lot of the button labels cannot be read under any pre-4.0
version of the AES (they're blank). Since I want as much RAM
free as possible when using MGIF, I usually don't load up
MultiTOS or Geneva. I'm not sure why this limitation?

Other than that, it's looking really good, so far. I haven't managed
to crash it yet! ;-)

What a joke! I'd like to know what part of it is an inclusion from
ST Review? These guys think they can stick anything on (or inside)
a magazine, and get away with it.

> Shame really. STR will be missed dearly.

Agreed. It was the last serious, quality magazine for english-speaking
ST users.

> What is...
> The resulutio switch box?

It`s a box you plug into the monitor-port and one of the extended joy-
stick ports of a Falcon. There`s three connectors on it: thru, VGA and
RGB.

It works (like every other gfx-accelerator on the Falcon) by feeding the
VIDEL-chip with a new pixel-clock. The advantage of RezSwitchBoz over
other similar products is that the pixel-clock is fully adjustable.

If you are looking for a cheap and easy way of improving your graphics
then it might be a good choice. Don`t expect miracles though...

Actually, I have. I was going to e-mail Johan directly, but I am on a 1040STe w/4 megs, and under geneve/neodesk4, it seems to be crashing rather often. Not nearly so much under just tos 1.6. I haven't taken the time to narrow it down to one d/a or auto prg, or a specific gif or jpg (both seem to crash equally often) but I suppose I could upon demand.

The other problem is that under tos 1.6, if I assign mgif.prg as an application run by ".gif" files, the mgif.opt file is not read. Is there an environmental variable for this?

Other than that, it's certainly on the way to becoming a brilliant program!

Yes there was such a program, but was it ever updated from version 0.9?

It is a software emulation of the Macintosh. It does actually work okay, but ONLY with a proper mono-monitor, not even with a mono emulator on my SC1224. I think it is actually a hack of a cartridge based emulator....by Dave Small - pre Spectre though....we're talking 1986 here.

Does anybody know of any other software Mac emulators? That are available from an FTP site?

Thanx

Thanks for the input Roger, but I'm (well, my friend is) having midi checksum and ack/nak errors with midi sample dumps specifically. They work fine with 1.0 and all three programs we tried gave errors when running on 1.4. Someone suggested in rec.music.makers.synth that TOS 1.4 has a unique midi thru routine that can cause problems.

Anyone got any ideas ?

There are articles in this newsgroup which go on about networking and Unix
on ST's.

I m ashamed to say I have moved on to an Apple Mac but would like to make
use of my 1040ST with 80Mb HD.

Can anyone point me in direction of Unix or Network software for 1040ST ???

524. DIP switches (jumpers) in 5.25 floppy drive (HELP !!!!)

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 00:46:35 UTC
From: npetrlik@public.srce.hr
Message-ID: <3esldb$mvs@nippur.irb.hr>
Source record: 173273

I have 5.25 inch internal PC drive, and I've connect
him to my STE (connections are all OK, and the power
supply for 5.25 is taken from the connector on motherboard.
That's all well and fine, but, how I must set
the DIP switches (jumpers) in 5.25 drive ?
Without setting thing obviously don't work ..

The DIP switches (jumpers):

In 5.25 drive there are 8 jumpers.

The marks besides are:

1st Group:

DD
HR
IL
IS
MM
MS
IR
IU
RI
RD
DC
SR

In 1st group the used slots are: MS, IU, RI, RD, DC, SR
Used means that the jumper is in the slot.

2nd Group:

In this group one slot is used, and besides the slots
there are no marks at all.

3rd Group:

TD
DS2
DS1
DS0

MX
DS3

The used ones are: TD, DS1

The only thing that I maybe figure it out is that
the marks beginning with DS (DS0, DS1 ..) are for
the disk selection (which one should be B, etc ..)

I want 5.25 (external) to be 'B', and the internal 3.5 inch
to be 'A'.

HOW must I set the jumpers ?

Any help would be wellcoming ..

THANKS.

>
>Actually, I have. I was going to e-mail Johan directly, but I am on a 1040STe
>w/4 megs, and under geneve/neodesk4, it seems to be crashing rather often. Not

Strange, it's been quite a while since I had a crash I couldn't explain
with MGIF on my Falcon and those bugs are all fixed. I don't run Geneva
or Neodesk, but I can't see what they could complain so loudly about.
MGIF works (almost) perfectly with MultiTOS on my Falcon.

>to one d/a or auto prg, or a specific gif or jpg (both seem to crash equally
>often) but I suppose I could upon demand.

I'd appreciate some more information about this (in email), such as what
kind of crashes (bombs, lockup etc) and when they occur. Buffer sizes,
display modes etc would also be useful.

>The other problem is that under tos 1.6, if I assign mgif.prg as an
>application run by ".gif" files, the mgif.opt file is not read. Is there an

Well, MGIF will look in the current directory for the MGIF.OPT file, so
you'll need to put one in the directory you're using. It should work then.

>environmental variable for this?

Yes, MGIF_OPT. It's mentioned in the README.1ST file, by the way.

>Other than that, it's certainly on the way to becoming a brilliant program!

:-)

New versions will appear on rand.thn.htu.se as they become available.
(Today I got the zoom/cut scrolling to work as it should.)

I only heard about that controversy a couple of days ago and am currently
following the discussion in the 'Independent JPEG Group' mailing list
with great interest.

If I've understood things correctly, those Unisys patents are not valid
in Sweden (or has GATT changed that?). Even if they are, I'm not sure
how they would apply to something that is not really distributed or
charged for in any way.
Someone said on the IJG list that a decoder was not covered by the patents
and if that's true, I can easily remove the GIF write code.

It'll be very interesting to see how this turns out.
After all, the US patents office has granted some absolutely ridiculous
software patents. Maybe this is the one that will finally make them see
some sense (perhaps they could hire some programmers with half a brain).
(I'm not saying that the LZW patent is one of the really silly ones.)

>following the discussion in the 'Independent JPEG Group' mailing list
>with great interest.

Just when I'd posted the last article the latest news dropped in on the
mailing list. This is supposed to be an official Unisys statement:

Unisys does not require licensing, or fees to be paid, for
non-commercial, non-profit GIF-based applications, including those for
use on the on-line services.

So, MGIF will continue to use GIF and it won't cost me anything. Puh!

At another point in the statement it's mentioned that Unisys will not
make _anyone_ pay for using the patents before 1995, so it looks like
all authors of ShareWare packages can now take a deep breath as well.
(I'd suggest double checking to make sure.)
To me it does not look like they can continue to use GIF, though.

======================
ATARI DISCOUNTS RUMOURS OF POWERPC LICENSING.
(January 6th 1995) Two people contacted us separately this week
asking whether we had heard of rumours that Atari will use the
PowerPC in a forthcoming machine. We hadn't - but an Atari spokesman
had, though he said there was no truth them.

There are a couple of variants to choose from. One story has Atari
re-entering the PC market with a PowerPC version of the ST. Atari
says it continues to monitor the PC market, but has no concrete plans
at the moment. The other rumour has the next generation of its Jaguar
games console using a PowerPC processor instead of its current
68k-family chip.

From: ross@earth.usa.net
Message-ID: <3esqgf$dp2@earth.usa.net>
Source record: 173280

> Has anyone seen Emagic Micro logic? I have my eyes set on Logic Audio, but
> don't have the money right now. What kind of upgrade path is availabe
> between the two? Any other advice/information?
>
> Thanks,
> Russ

I am fairly sure that Micro Logic is only for the PC (IBM), not positive though. Logic Audio Falcon is not being sold. It was given away as a free upgrade to LOGIC users due to the decision not to release the program. There is no support for the users who did receive it but it did come with the MAC manual (for the meesily shipping price of $30). So at this point I would suggest if you want Audio recording on your Falcon that Cubase Audio is the only current way to go. I use LOGIC myself and LOVE it !! And although EMAGIC doesn't support LAF they do support ATARI with LOGIC, NOTATOR SL, SOUND SURFER and SOUND DIVER (I can't wait for this one).

Any more questions (I'd be happy to try and answer them.)

I don't know whether or not you were kidding or not, Steve. In case you weren't, there is certainly a point in doing so. If there weren't, I wouldn't be spending all of this time putting together the Atari section of STReport, week after week. <<grin>>

There is plenty of Atari news, both the computer and Jaguar. There are some weeks that the Atari news has more coverage than either the PC or Mac sections (there are other times when there's considerably less!).

If you want a well-balanced online magazine, wiith platform coverage of all types (many Atari users are multi-platform users these days!), on a _weekly_ basis - STReport is the magazine to read. Ask many of your fellow Internet users - I send out issues to over 100 members weekly and I just recently started this "service" to them.

535. Simple modeler/renderer?

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 03:27:32 UTC
From: darmok@leland.Stanford.EDU
Message-ID: <3esur4$gjs@elaine38.Stanford.EDU>
Source record: 173285

Is there a simple, _complete_ 3-D modeler /raytracer prog for the Falcon for very cheap. I just want to do _fast_ 16-color models of standard 3-D object formats. Anything free or cheap out there that hopefully uses DSP? Thanx.

542. Is FAT messed up---how can I fix it

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 06:10:17 UTC
From: graphic@delphi.com
Message-ID: <xW36ReJ.graphic@delphi.com>
Source record: 173293

While trying to copy 4 files via my INTERSECT ram disk, 2 of the files gave a dialog box with the error message "invalid copy attempt". I tried to open the files in Wordplus (1stword) and then save them on the target disk. Well, I got a message that the specified directory (main) could not be found and therefore I couldn't get the files saved.
Now I tried to save the telecom buffer to this floppy tonight and I got the message "unable to open file" yet I could save to a different disk (no, the first disk was not full).
Have I messed up the FAT? How do I fix it? E-mail advice would be greatly appreciated.

543. Video Editing with the STe/Falcon

Better for you, that's right.

> Supporting the ST is something i do not understand at all. The ST is dead.
> Supporting a Mac is something i can understand, but it doesn't leave many
> hopes left for the Falcon.

Try to look at it from a developper's point of view: There are a lot
more STs (by several orders of magnitute, I guess) out there than
there are Falcons. So where is the biggest market for a new operating
system? Add to this the higher technical complexity of Falcon support,
and you know why the Falcon support has been rated second priority.

Nope. PCL uses standard images. Mostly RLL-compressed. PrinterControlLanguage
gives you the overall control of the commands and features available on the
particular machine.

HP-GL/2 is the vector-based language introduced by HP.

He's probably referring to those RasterImage Processors, you'll need to output
on high-end devices.

PCL is used to set the printer into the correct mode. (Printer Control
Language). It is not a describing language as PS.

On Plotters, HP-GL/2 is used for that. And has become a standard for plotters,
as PS has for printers.

NVDI send its images a RLL-compressed images, btw.

>I mean eg. PS-printer's inbuilt program which translates PS to raster.

>Annius V. Groenink | avg@cwi.nl | Private/Edith/ZFC:

I'm going to stick my neck out here & say that if someone has a 14Meg falcon
or a TT, then porting Mosaic to MiNT-X11 should be fairly easy (maybe
take a week or so). I say this having just port xvt to MiNT-X (get it
from my www page). This only really took a couple of days to port, and a
month of tinkering before realising that you had to use fixstk to set a
big default stack for X executables under MiNT.

My major problem is not having enough RAM (I only have 4Meg,
so until MiNT gets VM, or gcc decides to play ball with Outside, or someone
gives me a 14Meg expansion, thats it as far as my X-Windows tinkering goes -
at least under MiNT.

Linux is a different matter, and (although I've not tried it yet) I hear that
the X port for Atari Linux is at least as good as the MiNT one (ie. VERY).
And adding to that the fact that Linux already has VM, I think that Linux
Mosaic would currently be a much easier job than MiNT Mosaic (for me at least).

All that aside, I'm not doing it - I only have a bloody 2400Baud modem anyway,
so the pain of using SLIP is unreal......

Craig.

Date: 1995-01-10 12:02:56 UTC
From: neptune@galaxy.owl.de
Message-ID: <FAKLFBWBUP@galaxy.owl.de>
Source record: 173224

In <3emffg$ha8@news2.delphi.com> MARSALONE@DELPHI.COM wrote:

> WHat are the scanning frequencies for the high resolution monochrome
>mode on the Atari ST. Both Horizontal and Vertical freqs...

I couple of days ago I posted a small table with some data I figured out
myself. Here now is the "real" stuff:

ST/STE:
=======

Color: 15,625 KHz, 50-60 Hz refresh
Mono : 35,700 KHz, 72 Hz refresh

TT030:
======

Color (VGA): 31,500 KHz, 60 Hz refresh
Mono : 72.000 KHz, 72 Hz refresh
(TTM194/TTM195/Protar 19" monitor with ECL-input)

Falcon030:
==========

Color (RGB/TV) : 15,625 KHz, 50 Hz refresh
Color (VGA) : 31,470 KHz, 61 Hz refresh
ST-high (VGA) : 31,470 KHz, 61 Hz refresh
ST-high (SM124): 35,700 KHz, 71 Hz refresh

So the horizontal frequencies should range from about 15 kHz to 36 kHz or even
higher. The low mark will be the problem for most newer models. They simply
won't sync.

The vertical-range should be from 50 to 72 Hz or higher. That should not be
the problem.

Pure VGA-screens do _not_ work with an ST/STE. One should always go for a
Multisync with the specs from above.

My thanks goes out to Michael Ruge (mr@wi2.maus.de) who provided me with the
data given above.

>graphics-card especially for the Barracuda?

At the end of November, I've talked to the Wizztronics developer during the proTOS show in Hennef.

He mentioned that the Barracuda would have some kind of graphic enhancement on the board itself.

Let's put all the problems of termination and termpower and stuff aside, as
you've probably checked it, haven't you?

The problem you're describing here, sounds very much like a problem with
BUS-ARBITRATION.

Only real SCSI-devices like PC, MAC, Falcon can handle the arbitration
properly. With the right drivers, that is. AFAIK, only HuSHI >= 6.08 and the
latest HDDRIVER (3.5x?) can handle arbitration.

The SCSI-via-ACSI-Link-connection isn't capable of arbitrating at all. If this
really is your problem, you're out of luck. It won't work.

Perhaps Julian and Uwe could add their points to this matter. They're the
specialists.

I now some parts of it, but not as much as I'd like to know.

You seem to be the wiseguy, so go ahead an tell me ...

My crtitizism is based on the things I've heard from a friend who's working in
the graphics industry. Interchanging larger documents with many fonts IS a
problem. It is often discussed in decent mag's like the german c't as well.

Do you deny there are possible problems at all?

>There is no font problem anyway if you get your package to include the fonts
>in the PS file. That's what I do with PageStream.

Which makes the files somewhat bigger, doesn't it?

>solve. COuld anyoine advise? Do I need an upgrade or another computer
>STE or STEFM?

Do you have a Cubase Lite version 1, or Cubase 1.0?

If you have Cubase 1.0, I strongly suggest that you upgrade it to 3.1
as 1.0 (as every 1.0 -version of new program) is full of bugs, and Ste
wasn't even there 6 years ago.

Cubase 3.x runs in Every Atari (ST, STe, MegaSTe, TT, Falcon) with 1Mb.

You can run versions up to 2.5 with the dongle that came with 1.0, with
version 3.0 and upwards you'll have to upgrade the dongle as well.
So, if you know anyone with 2.5, "borrow" the disks - it's worth it.

Try the Cubase in a "clean" machine (= booted without any ACC's or
AUTO-programs) - if the bug is still there, you'll have to update
the program; if mouse works fine, the problem is a collision with
one or more of your ACC's or AUTO-programs. Put them back one by one
and see what causes the problem. Without ACC's you'll get also more
memory, if memory shortage causes the problem.
This strategy works for pinpointing every ACC/AUTO/memory -related
problem.

MegaROTFL. Calling for a reality-check here.

Does APEX use *anti-aliasing*? From what I've heard it does not. And so it is absolutely _worthless_ for any kinds of graphics or animation with a professional approach.

And comparing Apex on a Falcon with _anything_ on an SGI is more than rediculous. IMNSO (make that IM -not so humble at all- O).

>mind) including a 'toaster' like hardware deal called the "Video Funnel" which
>is being developed by Wizztronics (also developing the Barracuda 040 Falcon a

If VF is released as fast as the Barracude should've been released, it'll take time. Much time.

>>4. Any info on the TOS replacement Magic? Will this mean that we can run
>>TOS on a PPC?
>(like MultiTOS) but is much faster than MultiTOS or even SingleTOS! It is also
>faster than Geneva, but not as pretty. Currently it isn't written for PPC, but

What do you mean with "pretty"? The appearance of the OS is highly dependant on the *desktop* you're running on top. Compare Mag!C and Geneva with the same desktop and Geneva wouldn't stand a chance. Mag!C uses preemptive multitasking, Geneva kooperative MT.

>it is available for either Atari hardware or Macintosh '030 and '040 machines.
>I assume (but can't be sure) that it will work on Medusas and Eagles too. I'm

Mag!C 2.0 doesn't work on the Medusa. Version 3 will, as 2B have a Medusa in theit office ;-) Dunno about the Eagle. This one isn't even shipping yet.

>
> I'll tell you - It's C with differnet syntax, so why not just use C?

There are useful things even in the simpler BASIC dialects which C does
not offer. One such thing that comes to my mind right now is
the dynamic string management with the associated garbage collection -
C just doesn't have it. This has prevented many a program to be
converted from BASIC to C. In BASIC, a beginner just writes:

```
A$="FOO"
INPUT B$
A$=A$+B$
PRINT B$
```

And the program is absolutely correct. In C, you have to allocate
memory, move around string contents and free the string memory
explicitly, and that's often already beyond the skills or the
patience of a beginner.

Of course, once you've understood what strings really are, and even
more once you've run into performance problems due to the garbage
collector, you'll realize that "the C way" has significant advantages.

My point is: BASIC isn't just C in a nice syntactical wrapper; it
offers features which make it suitable for a beginner who
never wants to get into the fishy details of programming. For
everyone else, however, C (or just about anything else but BASIC)
is, IMHO, the better choice in the end.

GFABASIC is a very hideous flavor of BASIC. It has a very fast
interpreter, an attractive integrated development system (at least
for the time when it was written), and other nifty features.
This is what you see *first* from the system. Later,
you realize that both the interpreter and the compiler
are not too reliable and produce or execute "dirty" code, making
it hard for the developer to write programs which run on all
platforms or OS versions.

You NEEDN'T a Jag controller. Just connect _oridinary_ joystick (NOT
analog, but this from second mouse/joy port) to correct lines of Jag-Pad
port (Its something like in F030 reference guide). If you have any
problems please write - my friend has done it and it works...

I got a copy of this from a PD library when I first got an ST back in the 80's. It didn't work on my 520 (I didn't have a mono monitor at the time) so I wiped the disc thinking it was just a piss take. I'm kicking myself now 'coz it got pulled from all the PD libraries shortly after that for having a copy of the Mac ROMs included in the distribution.....

I think things would be a little different now, as there's a generally available Mac emulator for the PC with a copy of the ROM's included with it, and Apple don't appear to mind this....they are real old ROMs after all.

Craig.

580. Looking for UNIX-QWK Read

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 17:50:16 UTC
From: Don.Schmidt@f79.n105.z1.fidonet.org
Message-ID: <789889536.AA04262@jina.rain.com>
Source record: 173217

DK> I'm looking for a QWK-Reader to read Pakets created with uqwk
DK> V1.8.

Mountain Reader II ver 2.5 will handle any packet I've tried
includiing Bluewave. Suggest you give it a try. Its on many BBS's
as, M_READ25.LZH or, send a message to the author, Anthony Watson
on Genie, address: a.watson6@genie.geiscom

If Mountain Reader won't work, Anthony would probably appreciate a
QWK packet and consider adding the coding to his program. Mountain
Reader gets very high marks for reliability and performance and
features. The best for Atari computers, from the STs to the Falcons.

... Mountain Reader II, the offline reader that handles them all!

Have you ever managed to get it to import files properly? I have tried importing WordPefect 4.1 files, STWriter and RTF files into Marcel, and all it seemed to do was strip out all of the formatting codes.

Also, when I last tried it, the spell checker was S-L-O-W. I finally just loaded the document into WP 4.1, and it zipped it out in no time.

Not anymore. With the arrival of NVDI3 this isn't true anymore. Now it's fast,
reliable, high-quality. It should've been like this from the beginning.

But it came from Atari ...

Hello all!
I recently perchased an old Mega ST 1 with german TOS but an US-like
keyboard. Now TOS thinks the keyboard the keyboard to a german-style one and
most key-mappings of special keys are now wrong.
What can I do now?
Getting an english TOS is one choice, but it's difficult to get. Is there
any software around to change the key-mapping or keyboard-type?
Thanx to everyone who will hopefully respond!
CU
nils

P.S.: I do not read this group very often, so, if you are so kind to
respond, could you do it by eMail? Thanx again!

(blah blah blah) . . .
>Didn't I just read that Gadgets went under? How can one obtain this new
>version?

I am also trying to squeeze every last bit of use out of my Atari STe computer before it becomes totally obsolete (in the U.S., that is), and I have Spectre GCR to allow me to swap files between my Mac at work and home. Another thing I use Spectre GCR for is logging onto America On-Line. (AOL only provides software for PCs and Macs). I loaded AOL software 2.01, which comes on a 750K floppie (DS,DD). Now AOL has come out with its latest version - 2.5, and it comes on, you guessed it, a 1.44mb (DS,HD) floppy. Of course, Spectre GCR won't read a high density Mac disk, even if you have a high density disk drive, like I do with my Mega STe. Does anybody know of a way I can load on the new AOL software? Can it be put on two 750k floppies? Or, is it a lost cause? I suspect the latter. Post a response, or E-mail me at:

Markvanwyk@AOL.COM

592. MUNCH mono arts package -

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 21:01:00 UTC
From: Dan.Dreibelbis@balmybeach.gryn.org
Message-ID: <da7_9501120832@tor250.org>
Source record: 173156

For all of those interested in doing your own graphics or doing graphics manipulation in monochrome, and find the current art packages to be lacking in features or confusing to configure, I've got something to recommend!

I've downloaded MUNCH, a Norwegian program by Vegard Hosfey, from GEnie last week, and I've become pretty enamoured with it. As a matter of fact, in one afternoon I was able to knock up some fairly simple (with my drawing talent, that is) but effective looking graphics.

MUNCH runs in monochrome mode, and imports a number of different graphics files (among them .IMG, .PAC, .PI*, and .NEO). As well as the stock drawing tools, there are special 3-D effects and gradient fill functions, the ability to load custom fills, manipulation and effects tools included which will allow you to stretch, squeeze, outline, wrap around a cylinder, emboss, fade out....it's like a version of CRACKART for mono users.

Even better, it's possible to take the graphics and save them in GFA code, C, and assembler for use in your programs.

It does have a few restrictions, being that it is a demo and shareware (you can only save your work in its native .MNC format, the full program offers the ability to save in other formats), but this is one program to give a try . I know I'M registering it.

... It is not I who am crazy, it is I who am MAD! - Ren

Message-ID: <3ev0lv$b0o@rhino.cis.vutbr.cz>
Source record: 173235

Hello,

I need infos how to speed up some important parts of Falcon. I don't want to upgrade CPU (040 or so) or think about TT-RAM as these are too expensive for me.

So, I wanna to speed up CPU, bus, Videl, FPU and DSP. Is any commercial product with all these enhancements available? Or is it possible to combine several simply accelerators? (e.g. Blow Up for Videl, Skunk for CPU and I don't know what for the rest)

Can somebody told me what is accelerated by ddd card? (don't know exact name)

And what about communication problems between CPU and DSP on high clock? Is it common or just spec of some accelerators?

Thanks in advance.

599. PC to ST disk problems. PLEASE HELP!!

Newsgroup: comp.sys.atari.st
Date: 1995-01-10 23:35:09 UTC
From: joneil@infi.net
Message-ID: <3ev5jd$sok@lucy.infi.net>
Source record: 173245

I've been told that I can download files on my
PC (BBS,Internet , etc.), copy them to a 720kb
2S/2D 3.5" disk and put that disk in my ST and
copy the files to its hard drive. So far I've had
only limited success. I've been able to call up and
read a text file using this method (sometimes), but
copying or trying to run anything larger like a
program file returns the message "Data on the disk
in drive A: may be damaged. You must use the right
kind of floppydisk; you must connect your hard disk
properly." I've tried several disks including new ones
both DD and HD at 720kb, I've cleaned the heads on both
drives and I've tested the ST drive with disks formatted
by it and it seems to work fine on it's own. This is very
frustrating because I have access to so much software for
the ST on the A.A. but just can't get it onto the ST.

PLEASE HELP!

Thanks Very Much!!!

richards@pavilion.co.uk said:

> Can anyone point me in direction of Unix or Network software for 1040ST
> ???

Your best best is MiNT (which is a Unix BSD like extension for TOS) and
MiNT-Net (which gives BSD like sockets and TCP/IP) for MiNT. A Utilites
package (MiNTOS) gives things like 'init' and 'login', whilst an extended
file system driver (MINIXFS) gives Unix like drives with long file names
and links.

In addition to these there are many networking tools which run on top of
these. So far I've only tried NFS, but with very encouraging (partial)
results connecting to a Linux PC.

Many unix utilites have also been ported to MiNT, so it is possible to set
up a very unix like system on even a 1040ST, though if you want to try
running the X server you willl need 4 Mbs and probably a faster processor.

All this stuff is available on most FTP sites. A few worth looking at are:

micros.hensa.ac.uk

src.doc.ic.ac.uk

I could probably find the exact file names and directories - but I'm sure
somebody will have posted them already.

:-)

Roland.

Hi !

Does anyone know the Internet address of Mitsubishi ?
(The firm which sells informatic equipment)

I need somehow to contact them cause I have
5.25 floppy drive Mitsubishi, and I need the
explanations for the DIP switches on drive.

Thanx.

I've talked to Wilfried about this recently.

The decision for MagiCMac was made for commercial reasons only. Every year
about 50,000 users leave the Atari-platform. Most of 'em around X-Mas.

The only logical decision was to give the MagiCMac the priority, in order to
stay in business. There are most definetely more 68k MAC's out there than
Falcons. Their decision makes perfect sense to me.

But from what I've heard, Mag!C3 shouldn't be too long ...

tgz means tar.gz, it's a file which
has been 'tared' (make a single file with several files) and then 'zipped'
with gnu ZIP.

You can find the TTP progs to handle these archive file formats on the ftp site :

ftp.cnam.fr, in pub/atari/sthing... or in any ftp site for Atari, I think.

Have a good Year,

> smoore@chowgar.demon.co.uk
Hi,

You need gzip and gtar to uncompress. gzip/gnutar aviable on
ftp-server ftp.fu-berlin.de in pub/atari/gnu/
To extract, make the folloing steps:
1. start gzip, option -d <file.tgz> and an .tar-file is created
2. start gtar, option -xvf <file.tar>, archive is complet extracted

Altenative: move .tgz to .gz and after call gzip move nameless file
to .tar

That all and worked under MiNT and TOS

So long, Markus vicari@chemie.fu-berlin.de

Why not put an optional keyboard control to these games? For us
recreational games-players it would do just fine.

Think about that, games-programmers!

>
>Is it worth it?

It's worth it. You get a softer sound with no noise at all. And you can use
DAT's level meters. If you record digitally from eg. a CD-player, you don't
have to set the recording level, and you get an exact copy of the original
material.

>How good are the converters on the Falcon compared to consumer/pro DATs?

I have info that the converters in Falcon are quite good, but the
electronics (wiring/pre-amplifier) are ruining the sound.
If you listen to it really loud, you can hear all sort of whistle and
pops, and FDI is the cure for those too.

All new DAT's have better converters, as in them a bigger percentage of
the machines cost is put to converters, than in Falcon.

If you use a portable DAT, you can also record wherever you want (in
the bathroom ;-)) using a headphone click, away from the fan noise,
and then dump the stuff into Falcon, and put it to a right place.

And you can also do Audio/HDD -backups to a DAT (optical cable is
recommended (by me!) for that function).

Sounds to me like the solder joints have gone on the ports themselves.

What you need to do is to open the keyboard up and resolder the joints. Be very careful when you do this else you will lose some of the rubber keycaps.

The return key only has one rubber cap under it BTW.

Magic Mac is developed by Application Systems Heidelberg in Germany and is supported by Apple Germany. I was at the ProTOS show in Germany last November, and I can confirm that MagiC Mac running on an Apple Mac works very well indeed.

Phone Application Systems Heidelberg 00 49 6221 300002.

Of course, the software you use with MagiC Mac and Ease must be 'correctly written' to run on TOS machines. As a general rule of thumb, any software that runs under MagiC on the ST or Falcon030 should run without problems on the Mac.

It's bloody fast too! On a Mac LC475 (68040 25/50Mhz), Falcon software typically runs three times faster than on the Falcon and ST software runs up to ten times faster than on an 8MHz ST. All this for 300DM, that's about 129 UKP.

Put it this way. I'm going to buy it!

tgz is the abreviated, DOS friendly quivelant of .tar.gz. This means that it
has been compressed with gzip, and archived with tar. To uncompress it first
run gzip -d archive.tgz, then do tar -x -f archive.tar

I can't rememember where I got gtar and gzip, but I think HENSA has both of
them.

Err.. not really. I think I typed Geniew (supposed to have said Genie).
Just a typo, sorry for the confusion.

>there are Falcons. So where is the biggest market for a new operating
>system? Add to this the higher technical complexity of Falcon support,
>and you know why the Falcon support has been rated second priority.
>

Looking at it from the developers point of view, i only spot profit. This
may start a major argument, but i only see one benefit in buying NVDI3.0
and that is alot of money for the NVDI team. Look at it this way, when
Magic is released, you probably don't need NVDI at all.

I know there is alot of of ST owners out there, but what is the idea in
getting/creating a new computer if it isn't going to be supported with
software. And if you keep on suporting old (outdated) computers, you'll
end up beeing the loser, as people will start seek other alternatives,
(why do you think so many people has left the atari platform ?).

Atari co. made the Falcon more than a year ago. Look at the lack of support
it's getting, and start wonder why it doesn't sell that good. I blame
Atari Co. as well as the developers and the programmers for this.

Source record: 173182

Woops.. It appears my editor has gone walkabout and the local news server is doing wierd things - even by my standards.....

...anyway (as I type without an editor)... recently I got hold of tapebios for my Atari STe (4meg with 2 20meg apple drives and a viper 250 archive tape drive) I can run the tapetest utility without problem and the viper goes through its paces without flaw, but when I try using the DUMP utility (comes with tapebios) the system just sits there and hangs. The tape drive light comes on then nothing.

I am using an Adscsi plus card and the version of tapebios is from 1992. I tried to mail Alanh@logitek.co.uk but cant get through (he's the author apparently)

Oh yes, the viper is set to SCSI id 5 and the two HDs are 0 and 1 for drives C and D respectively.

What sort of alternative backup softare is there? I am contemplating writing a backup utility myself (anyone want a file based backup?) but it would be nice to NOT reinvent the wheel and my Atari programming experience is not vast.

Post or email replies (to the address below, not this account)

thanks in advance

Installing lynx isn't that hard!
All you need are vconsd, /usr/lib/terminfo/* and lynx. Dont't use the
lynx.cfg file, it crashes the system (at least mine).

Big number of users of oridinary pc's becouse there will be no clones of
PPC (or DEC/SIG and others) systems ever (maybe a small amount, but not
so much as now) and I think that in oridinary ps'c world there will be
nothing more, then mc68060 or 686 (?-). So peoples will be buing
'original' systems.

regards,

Simon.

R > aren't multi task friendly seems to be growing weekly.

I don't know about with MagiC, but I DO know that Mountain
Reader II (which I don't ever hesitate to recommend as a reader
program) works fine under Geneva in multitasking mode, and it has
been designed to work under MultiTOS.

In any case, why not download the demo Anthony's put out and try
it out under MagiC. Wouldn't hurt - and then you could give us a
report on how it works. :)

You could also ask Anthony Watson himself if he knows of any
incompatibilty under MagiC - he can be contacted at
a.watson6@genie.geis.com . He's pretty good at response to E-mail
regarding his products - and has been pretty good at coming up with
upgrades to his products for his users.

You're in luck - there is a desk accessory and AUTO program
floating around that will allow you to re-map your keyboard to the
proper setup you need. It's called CKBD_13.LZH , and it's been a
recent upload to a number of bulletin boards here in Toronto in the
past couple of weeks. I would imagine that it's also somewhere on
the Internet.

******* Tapebios problem text Deleted *******

I use Tapebios for backups to a Viper 2150S, I've had problems when Chamelon.acc is installed, I can't restore partitions.

I have also found a problem with the shell (Okami15) I run Tapebios from, it hangs the ST when you try and exit to the desktop (this only happens with Tapebios).

Is the Tapebios.INF file set correctly, you need to have the SCSI ID and a timeout value in there.

Otherwise, everythings fine & I've used it for a few years now.

The author is not contactable via the old e-mail address, I presume he has also left the ST scene. He also ported a version of GNUTAR which works with tapebios.

NB: the readme files mention that he had many problems with Viper 2150S units & semed to believe that there would always be errors.

641. 2.5Mb simm problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-12 10:52:44 UTC
From: Bales_N@CIRAD.fr
Message-ID: <9501111413.AA00143@montp.cirad.fr>
Source record: 173127
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

CEO file contents:
Hi and Happy New Year!

I have an STE with TOS 1.6 fitted with 2.5Mb. Due to a bug with the MMU, I have to use run SIMMFIX.PRG in the auto folder if I want the memory to be correctly recognised.

Now, up to here I've had no problem, only some progs crash when they attempt to access the higher memory if SIMMFIX hasn't run. This only happens with games that autoboot without an AUTO folder on the disk (eg: EPIC).
All I can do in such cases is open the machine, remove the shielding, take out the extra simms, put the thing back together again.

So I was wondering if there was any (easy) way to put in some switch that would disable/enable bank 1. Another solution could be a program like simmfix, but would be reset resistant...

Any ideas suggestions out there?

Thanks in advance

Nick.

>So, I wanna to speed up CPU, bus, Videl, FPU and DSP. Is any commercial
>product with all these enhancements available? Or is it possible to combine

I've accelerated my falcon with the "Speed Resolution Card" from Hard&Soft
in Germany. This card accelerates the bus clock to 18 or 20 MHz, the CPU-clock
to the same or the double of it. Maximum speed is then 20Mhz bus/40Mhz CPU.
FPU is at 32 MHz.
The pixel-clock is continuously adjustable -> better resolutions than Blow Up
or Screenblaster!
But this card has some problems with its software though.
In my falcon it's impossible to work with the DSP and the blitter
with 20Mhz bus-clock (but other falcons can).

Don't be silly. We are a UK based PD Library (OK so we're not exactly some huge company but we are an Atari based company if nothing else) and we've used Calamus for at least a year in out opening months.

> >Calamus is a _very_ powerful tool.
> But still no PostScript. Unless you buy a half-baked PS module which
> costs as much as SL itself.
>

Please be fair to ole' Calamus. I used it for a number of years and it really was quite good in it's time and it's not one of those products that still insists on the huge price tag. You can buy it at less than 60 (from us of course) which I personally think is very fair for it.

Okay so it doesn't have Postscript compatibility but it DOES use a vector font format which gives a pretty good print output. It certainly gets my thumbs up as being the best value DTP package on the current market. I am talking about the original 1.09 version.....

But Euler is not a symbolic algebra program; it's strictly numeric (a
little like matlab). Reduce is a commercial product. Form is capable
of some symbolic work, and there is a version available for anonymous
ftp (I forget where I got it; if you need to know, mail me).

John

651. Yet More MiNT/Minixfs queries. :)

Newsgroup: comp.sys.atari.st
Date: 1995-01-12 12:58:04 UTC
From: cs93dlh@dcs.exeter.ac.uk
Message-ID: <D2AMot.D0r@exeter.ac.uk>
Source record: 173002

Yesterday I did a very silly thing and turned the computer off before
minixfs completed a delayed write. Realising immediately what I had
done, I turned it back on and ran fsck over the minix drive.
It reported "Orphaned Inode 22" and asked if I wanted to reconnect it.
As far as I can tell, the files on the drive are ok at the moment, so the
question is, what does this mean and what will happen if I tell fsck to
reconnect it?

>This has been compressed twice. The first by TAR and the second Gnu ZIP.

The intention of your mail goes in the right direction, however it is not
quite right.

TAR doesn't compress it just makes _one_ archive of whatever files you've
selected. Now you've got only one *large* file to handle.

This archive is compressed using GNU-Zip, then.

>So to reverse this, un-Gnu-zip it and then de-tar it.

That's right ;-)

Isn't there an option to call TAR from within GZIP? With a special parameter?

654. REPOST: Falcon Spec Sheet

Newsgroup: comp.sys.atari.st
Date: 1995-01-12 14:49:28 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3f3fho$2tv@dux.dundee.ac.uk>
Source record: 173193
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st

```
Okay, here it comes...again!!!

Atari Falcon 030 Specifications
------------------------------

CPU: Motorola 68030 32-bit microprocessor @ 16MHz w/ 32-bit bus
FPU: Motorola 68881/68882 @ 16MHz (optional)
DSP: Motorola 56001 Digital Signal Processor running in parallel @ 32MHz
w/ 32kWords (24-bit) of local zero wait state static RAM
ROM: 512kB
RAM: 1, 4 or 16MB(14MB usable) on daughterboard (RAM is 32-bit wide)

Expansion bus: Internal 'Processor-Direct' slot for 386SX emulation
(third party 386SX emulator nearly completed) or other
co-processors/etc.

Video: (See below for specific video modes/resolutions.)
16-bit BLiTTER @ 16MHz (also handles hard drive access)
Accepts external video sync to allow high quality genlocking
Overlay mode for easy video titling and special effects
Overscan support
Hardware-assisted horizontal fine scrolling
VIDEL (video controller) sits on 32-bit bus

Audio: Stereo 16-bit Analog-to-Digital DMA input
Stereo 16-bit Digital-to-Analog DMA output
Eight 16-bit audio DMA record/playback channels
SDMA sound/DMA co-processor

Ports: 128kB cartridge port
2 9-pin mouse/joystick ports
2 15-pin STe enhanced analog/digital controller ports (Atari also
has new analog controllers w/ a joystick, 3 fire buttons, and a
12-key keypad)
MIDI IN, OUT/THRU
Bi-directional parallel port
RS232C serial port
SCSI II w/ DMA
Analog RGB/VGA/composite video connector
Stereo headphone out (1/8" mini-jack)
Stereo microphone in (1/8" mini-jack)
DSP port (up to 1MHz data transfer rate)
RF modulator for TV hookup
Localtalk compatible LAN (up to 250kbaud transfer rate)
```

Misc: Internal 1.44MB 3.5" HD floppy
Internal IDE 2.5" hard drive (optional)
Pre-emptive mulitasking OS (MultiTOS) w/ adaptive prioritization
and inter-process communication (also 68040 compatible)
Realtime clock and battery backed up RAM
1040ST-style case w/ internal fan
North American availability in mid-October

Price: 1MB/no HD - $799 list
4MB/65MB - $1399 list

Resolutions available on the Atari Falcon030 (c) 1992 Atari Corp.
Written by John Townsend
==========
This document may be re-printed again and again as long as the Atari
copyright remains intact.
==========

A couple of notes: Unlike previous machines, there are just too many
resolutions to give each resolution a name. Therefore, I will do my best
to describe what the resolution is and which monitor it is on.

- NOTE: TV and a Color Monitor are the same.. by Color Monitor, I am
talking about the standard SC1224. By VGA, I mean a standard VGA
Monitor.

40 column modes ("column" means the number of x pixels divided by 8)
---
4 color, normal, TV: 320x200, 4 colors, 2 planes
16 color, normal, TV: 320x200, 16 colors, 4 planes
256 color, normal, TV: 320x200, 256 colors, 8 planes
True color, normal, TV: 320x200, true color

4 color, interlace, TV: 320x400, 4 colors, 2 planes
16 color, interlace, TV: 320x400, 16 colors, 4 planes
256 color, interlace, TV: 320x400, 256 colors, 8 planes
True color, interlace, TV: 320x400, true color

4 color, normal, VGA: 320x480, 4 colors, 2 planes
16 color, normal, VGA: 320x480, 16 colors, 4 planes
256 color, normal, VGA: 320x480, 256 colors, 8 planes
True color, normal, VGA: 320x480, true color

4 color, line-doubling, VGA: 320x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 320x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 320x240, 256 colors, 8 planes
True color, line-doubling, VGA: 320x240, true color

80 column modes
---
2 color, normal, TV: 640x200, 2 colors, 1 plane
4 color, normal, TV: 640x200, 4 colors, 2 planes
16 color, normal, TV: 640x200, 16 colors, 4 planes
256 color, normal, TV: 640x200, 256 colors, 8 planes

True color, normal, TV: 640x200, true color

4 color, interlace, TV: 640x400, 4 colors, 2 planes
16 color, interlace, TV: 640x400, 16 colors, 4 planes
256 color, interlace, TV: 640x400, 256 colors, 8 planes
True color, interlace, TV: 640x400, true color

2 color, normal, VGA: 640x480, 2 colors, 1 plane
4 color, normal, VGA: 640x480, 4 colors, 2 planes
16 color, normal, VGA: 640x480, 16 colors, 4 planes
256 color, normal, VGA: 640x480, 256 colors, 8 planes

4 color, line-doubling, VGA: 640x240, 4 colors, 2 planes
16 color, line-doubling, VGA: 640x240, 16 colors, 4 planes
256 color, line-doubling, VGA: 640x240, 256 colors, 8 planes

and lastly.. there are compability modes for ST Low, ST Medium, and ST High on both VGA monitors and SC1224 monitors. (On a color monitor, ST High is achieved by using the interlace mode).

Also, the ST Monochrome monitor (the SM124) will work with Falcon030 as well. However, it only supports one resolution: ST High Resolution.

All modes on a TV can be overscanned. This means multiplying the X and Y resolution by 1.2. For example, modes with 320 pixels of horizontal resolution (X res) will become 384 pixels across, and modes with 640 pixels will become 768 across. Overscanning is done in the X and Y resolution. You can't do them independently. Special Note: On a VGA monitor, overscan is "faked".. since the video hardware doesn't have the capability to do overscan on a VGA monitor, we made it so that if a overscan mode is set on a VGA monitor, you still see the normal size screen, but the screen is a window onto the bigger overscanned image. Make sense? We did this for compatibility. This way if a game that has an overscanned starup picture can use the same pic on both the VGA monitor and the TV monitor. Pretty cool, eh? <grin>

BTW.. Overscan can NOT be set from the desktop. The AES and Desktop will work just fine with it, but because you can't see the parts of the screen, we thought that that option shouldn't be available from the desktop. We don't want to confuse people. However, Overscan can be set using a new XBIOS call (Vsetmode()).. so it is still available.

I hope I haven't made any mistakes. I triple-checked this document in search of errors and I couldn't find any. If you do find some, send me Email on GEnie (to TOWNS) or CIS (70007,1135) and let me know.

-- John Townsend, Atari Corp.

P.S. Anyone who would like to reprint this message, please do so! The smaller the number of times I have to type that message, the more my fingers with thank you! ;-)

After looking at this one more time.. one point to clear up: By saying SC1224 Color Monitor, I mean any Color Monitor that Atari

have manufactured for the ST/Mega/STE/MegaSTE computers. Clear
as mud? ;-)

In-Reply-To: kjohnson@castor.cs.uga.edu (Kristopher Johnson)

I found this file on the local ATARI Company's BBS : (original in Dutch)

This article is written by Wilfred Kilwinger (Support Manager) for
Atari Briefing, the newsletter by Atari (Benelux) B.V. for the Atari
user groups. It was specifically stated that it could be reproduced. I have
translated it in English with the assumption that an English translation
would be considered the same as the original.

The original also contained a description of all the features of the Falcon
which have been reproduced here a zillion of times so I did not include
these.

Atari custom chips

VIDEL

The VIDEL takes care of the video functions of the system including
overscan, overlay mode and true color graphics

COMBEL

The COMBEL is the system manager of the Atari Falcon030. This chip controls
all system functions. Also the BLITTER is built in in this chip.

SDMA

The SDMA is the Sound DMA and controls the sound part. We have built in a
unique matrix switch function in this chip (more details in the second part)

KEYBOARD PROCESSOR

The keyboard processor has been improved and is now also suitable for high
resolution mice.

Besides the above custom chips the Atari Falcon030 has a number of standard chips like the Motorola 68030 and 56001 DSP. Another important chip is the CODEC in which the 16 bit AD and DA converters are located.

Video modi

As you can see in the survey of Operating System calls
the video hardware is complete sotware controllable. The following
combinations can a.o. be chosen:

Mode Resolution Bit planes Colors Palette

ST LOW 320x200 4 16 4096
ST MED 640x200 2 4 4096
ST HIGH 640x400 1 2 4096

True Color 640x480 8 256 262144
320x200 15bpp 32768 N/A

The last mode asks for some explanation. Here there is no color palette but
15 bits per pixel to describe the pixel itself. The format is
RRRRRGGGGGXBBBBB. VDI supports this mode thus programs that have not been
written for this mode specifically can use it nevertheless.
X is the overlay bit and can be used for video titling and special effects.

320x200 16bpp 65 N/A

This mode is called the slideshow mode, is not supported by the VDI, you
are on you own. X is an extra green bit.

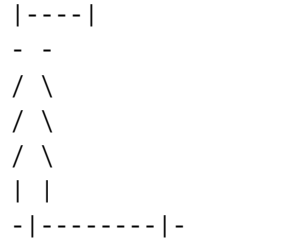
True Color in 640x480 is not possible because of the bandwidth of VGA monitors.

Mode Resolution Bit planes Colors Palette

VGA 320 of 640 1,4,8 2,16,256 262144 (Overscan
Video 200 of 400

With Video we mean the Atari SC-monitors, the TV modulator and/or the
composite video output.

All modes can be gegenlocked. With adaptors we convert
the 15-pole video bus to thee standard Atari or VGA connections.



Matrix coupling

To make the system performance in the audio part as good as possible Atari
designed a miniature 'telephone exchange' that can easily connect the
source devices to the receiving devices. Also it is possible to make more

than one connection at a time.

De volledige beschrijving van bovenstaande functie's staat in de Falcon030 Developers Documentation.

VIDEO SETMODE

```
int setmode( int modecode );
```

The setmode(int modecode) call is used to place the Falcon/030 SHIFTER into a specific mode. A bit-encoded value (called a "modecode") is passed to setmode() to set the mode. setmode() returns the previous mode that was set.

To help make the building of modecode values easier, here is a table of defines:

```
#define VERTFLAG 0x100
#define STMODES 0x80
#define OVERSCAN 0x40
#define PAL 0x20
#define VGA 0x10
#define TV 0x0

#define COL80 0x08
#define COL40 0x0
#define NUMCOLS 7

#define BPS16 4
#define BPS8 3
#define BPS4 2
#define BPS2 1
#define BPS1 0
```

Using these defines, you can build a modecode for any possible mode. For example:

For True Color Overscan:
modecode = OVERSCAN|COL40|BPS16;

For ST Medium Compatibility mode on a Color Monitor/TV:
modecode = STMODES|COL80|BPS2;

For ST Low Compatibility mode in PAL on a Color Monitor/TV:
modecode = STMODES|PAL|COL80|BPS2;

For 256 color, 80 column mode on a VGA monitor:
modecode = VGA|COL80|BPS8;

If you have a modecode and wish to know how many bits per pixel it
has, use the following:

if(modecode & NUMCOLS) == BPS16)
do_something_cool(); /* You have true color mode */

The setmode() call will return the previous modecode set. You must use
this value to get back to whatever mode you were in before you made your
setmode call.

int mon_type(void)

The mon_type() function will return the kind of monitor that is currently
in use. Here are the possible return values:

0 = ST monochrome monitor
1 = ST color monitor
2 = VGA monitor
3 = Television.

void ext_sync(int flag)

This function sets or clears external sync. If flag is set, external
sync is enabled. If flag is clear, then internal sync is used.

SOUND-calls

locksnd();
Used as a semiphore to lock the sound system. From other applications.

unlocksnd();
Used to release the sound system for other applications to use.

soundcmd(mode,data);
This command is used to get or set the following sound parameters.
If a negative number is used as the input then the current setting us
returned.

MODE OPERATION MEANING

0 LTATTEN Sets the current left channel output

1 RTATTEN Sets the current right channel output

2 LTGAIN Sets the current left channel input gain.

3 RTGAIN Sets the current right channel input gain.

4 ADDERIN Set the output of the 16 bit signed adder to
receive it's input from the ADC, Matrix or
both.

5 ADCINPUT Set the input the the ADC. The input can either
be the left and right channel of the PSG or the
left and right channel of the microphone.

6 SETPRESCALE Used for compatability. This prescale value
is used when the DEVCONNECT() internal
prescale value is set to zero.

setbuffer(reg,begaddr,endaddr);
This function is used to set the play or record buffers. REG selects
playback or record, while begaddr and endaddr are the buffers beginning
and ending locations.

(int) reg - (0) Sets playback registers.
- (1) Sets record registers.
(long) begaddr - Sets the beginning address of the buffer.
(long) endaddr - Sets the ending address of the buffer.

setmode(mode);
This function is used to set record or playback mode. The modes are as
follows:

MODE OPERATION
(int) 0 8 Bit Stereo
(int) 1 16 Bit Stereo
(int) 2 8 Bit Mono

settracks(playtracks,rectracks);
This function is used to sets the number of record or playback tracks.

setmontracks(montrack);
This function is used to set the output of the internal speaker to one of
the four tracks currently playing. The internal speaker is only capable of
outputing ONE track at a time.

setinterrupt(src_inter,cause);
This function is used to set which interrupt that will occur at the end of a
frame. If the frame repeat bit is on, this interrupt is used to allow for
double buffering the playing or recording of sound. Interrupts can come from
TimerA or the MFP i7.

buffoper(mode);
This function is used to control the operation of the play or record buffers
in the sound system. The input to this function is a bitmap. If mode is set
t0 -1 then the current status of the buffer operation bits is returned.

NOTE: The sound system contains a 32 byte FIFO. When transferring data to
the record buffer, software MUST check to see if the record enable (RE) bit
was cleared by the hardware. If the bit was cleared then the FIFO is flushed,

if not then software must flush the FIFO by clearing the record enable (RE)
bit.

dsptristate(dspxmit,dsprec);
This function is used to tristate the DSP from the data matrix.

gpio(mode,data);
This is used to communicate over the General Purpose I/O on the DSP connector.
Only the low order three bits are used. The rest are reserved. This call,
depending on the mode, can be used to set the direction of the I/O bits, read
the bits, or write the bits.

devconnect(src,dst,srcclk,prescale,protocol);
This function is used to attach a source device to any of the destination
devices in the matrix. Given a source device, this call will attach that one
source device to one or all of the destination devices. This call also sets
up the source clock and prescaler, protocol and protocol source if used.

sndstatus(reset);
This function gets the current status of the codec.

buffptr(pointer);
This function returns the current position of the play and record data buffer
pointers. These pointers indicate where the data is being read/written within
the buffers themselves. This function is also used to determine how much
data has been written to the record buffer. See buffoper().

The above is not yet complete. Atari has also routines for
JPEG and andio conversion.

>so there's plenty of room for Atari to screw up...
>
For anyone who hasn't seen the latest AEO, the Falcon appears to
have been design as a 24 bit computer, partly to maintain compatability
with existing software. This doesn't mean third party boards etc can't
extent that, but it explains the 14 meg memory limit. The other captures
from Jim Allen posts to GEnie say that the Falcon chips all seem to talk
at 16mhz. Another poster mentioned here that there's an 8bit processor to
dsp channel, I guess for uploading code into the dsp, though I don't
know if that means you can't tell the dsp to load a program from a memory
location itself, which would be faster, I'd guess.
Motorola says the top speed the 56001 is clocked at is 33mhz, so the
ad/da converters must be the parts clocked at 50mhz.

>second DMA/CODEC rate. This is the same as the STE/TT.

In the very techie "test" of the Falcon in the German C'T you can read a
differend story:

"[external/internal clock, prescale 4-24 or 128]. Internally there is a
27.175MHz clock to select the for the STe known sampling rates of
12.5KHz, 25KHz and 50KHz, or 32MHz in order to use the full bandwidth of
the memory transfer, with an sampling rate of 62.5KHz on eight 16bit
channels. This is also the upper limit for the external clock."

(if the about dosn't make any sense then it is probaly because my german
is even worth than my english)

-Klaus

[...]

Hmmmm... I guess this 'Daniel Osborne' guy must be a REAL pirate, eh?
Seeing as how he's in the navy and all. :)

But seriously, gang... how about a little discretion here? Like I said
before, I doubt if even Atari cares very much if anyone pirates an old
disk copy of TOS 1.0, but that's no reason to rub their face in it!
Try using email instead of making a public post about pirating goods, OK?

After all, piracy costs, courtesy is free.

Cheers,

-Hutch- @ Fair Dinkum Tech

P.S.: Good luck in getting any of your old games to run from a disk
version of TOS 1.0, anyway. Few have had any success.

Probably.

The first minor bugfix-update for NVDI 3.01 is expected in a couple of weeks.
Perhaps some problems with your publisher are solved then. Hava you reported
the problems to anyone?

Hmmmm... to the best of my knowledge, there isn't such a book as you describe,
at least not one specifically for the Falcon.

One of the best hardware books out there (which contains a wealth of info
about all sorts of things Atari) is 'The Atari Compendium.' Available at more
enlightened book stores everywhere, or by mail order, anyway. :) I'm not sure
who the UK distributor is but I'm sure it's available somewhere there.

I already found out that Euler wasn't what I wanted. Never mind, I'll
write a symbolic algebra program myself. It's always more fun than
simply buying it, if your need for it is not too high.

Expect a PD version before 2000! :-)

Isn't is time for a full distribution in the spirit of Slackware?
I.e., something moderately easy to install? One of the reasons
I never really got into MiNT for example is because it is such
a mess. Let's not make that mistake again with Linux...

If there was a nice full distribution I'd install Linux on my
TT *today*.

>doesn't provide any information either.

If you're lucky, the parity generation can be disabled by command. ICD ships a
tool BOOTFIX to do exactly this. Other HDD-software, e. g. SCSI.Tools or
HDDRIVER do the trick as well (usually, that is ;-).

A computer capable of generating/handling parity is required for the step.
TT's, Falcon's, or the newer ICD's, GE's will be fine.

>hoped-for-release date, Chroma is now available as Apex Media.

Apex Media is a _complete_ rewrite of Chroma. It is _much_ more advanced, with tons more features, and is probably the most important piece of software to be released for the Falcon in a _long_ time.

If you don't believe me, go grab the _official_ demo which has just been released. This is not the German only beta that's making the rounds, but the official demo released by BSS in the past day or so. I've just uploaded it to ftp.cnam.fr, expect it elsewhere _real_ soon.

Brian

> . . . . out a'here till mid April!

1) Have you a backup of your hard drive?
2) If so, try to back up those files new since your last backup
3)go to another virus free atari and make a virus checker boot disk. This
would be a floppy with your hard drive boot file on it, and a virus checking
program, and a disk formatting program.
4)Boot from this disk and check for virus's
5)OR just reformat your hard drive, and restore your backups[much more fun :)]

674. Re: AMOS pro for Falcon?

] I know this may sound a bit strange but in an official peace of
] Atari literature they mention that Amos pro will be released for the
] Falcon. Does any one know if this (like many other plans) has been axed?

I take it you mean STOS not AMOS (Why would we want the Amiga version? :)

It has indeed been axed. The program is apparently finished, they just
don't want to support Atari anymore.

I seem to recall reading or hearing that a stock 520ST can only handle up to a 9600 bps modem, but that a modification to the system can clock-double the port and allow higher-speed communication (14.4k desired). Any help would be greatly appreciated!

Try uploading the AOL software to a local BBS, and then downloading it to
your "Mac" or send it from a friends machine over the modem.
BUT _why_ can't you just download the new software directly from AOL???

TOWER2.TXT/Text Bytes: 10639, Count: 46, 22-Nov-94

Title : The LightHouse Tower - STFM upgrade by a user
Keywords: TOWER UPGRADE HARDWARE ST FALCON

The Light House Tower - a user's do it yourself upgrade for the
STFM. This article has been written to show what your system can be
made into with the aid of the LIGHTHOUSE Tower case and keyboard
kit. Available for STFM, STE, Mega and Falcon computers.

The Light House Tower - A User's Do it yourself upgrade!
^^
This article has been written to show what your system could be
made into with the aid of the LIGHTHOUSE Towersystem.

What is it?
^^^^^^^^^^^
I will assume here you all know what a tower case is. The main
tower comprises of three metal component's, The first is the
internal frame. Imagine a suitcase with it's lid turned over and
the front removed. You have a top and bottom, hinged at the
back. The mother board fit's into the base section while
floppies, Hard Drives, Extra PSU's and interfaces go in the top
section. Next we have the two outer Metal shell's. These give

the tower it's 'case' and makes it look like a proper tower.
Lastly is the front plastic pannel which contain's the holes for
the floppy drive cover's, which are cut to the required size.
There is also a hole for the Power switch and reset button.
Other bit's include a multi-board which control's the floppies,
reset switch and thermo sensor. A replacement power switch and
reset button are included along with a keyboard connection
socket. A bag of nut's, bolt's and other such item's is included
along with the tower's own rubber feet. Also included is the
keyboard kit, this comprises of a metal base shell for the
computers original keyboard to sit into, a small curcuit board, a
plastic cover and the essential rubber feet!. Also included is a
cable to connect the keyboard to the tower system.

Who's it from and how much.
^^^^^^^^^^^^^^^^^^^^^^^^^^^

In England the Tower is available from:
System Solutions, Windsor Business Centre, Building 2,
Vansittart Estate, Vansittart Road, Windsor, Berkshire, SL4 1SE,
UK.
TEL: 01753 832212 FAX: 01753 830344 (U.K. Dialing Codes!!!)

The manufacturer:
LIGHTHOUSE, A&G Sexton GMBH, Riedstr. 2, 7100 Heilbronn.
TEL: 071 31/9 57 20 FAX: 95 72 34
(If the above mean's nothing to you then join the club.)

The Price's vary for each system's requirements.
The STFM Tower Cost's L200, but a Falcon Tower is slightly less.

The Clause and comment's.
^^^^^^^^^^^^^^^^^^^^^^^^^

This is not an instruction manual or in any part designed to
help in the construction of the above tower. The writer takes no
responsibility and is not liable for anyone attempting to follow
these documents. This is for information only and no part
herein may be published as instruction's or a guide for assemble.
I am a qualified electrical engineer and have used standard
static provention to ensure the long life of my I.C's.

There is one MAJOR problem with the Tower kit. It's the Manual,
What can I say realy, It's in German (I think!). I can't read
another language so the manual was no use to me. You will
probably find the same. However there are plenty of drawing's
included and these help a great deal in the assembly of the
tower. System solution's will give telephone help or will make
your system if you send you computer to them. (Cost's more!)

I could not afford the expense of sending them my ST and also I
had a few of my own item's to fit, so took a few day's off work
and built the system with music and solitude. It took me 5 day's
to build the complete system and a few week's to iron out all the

bug's in the sound system. Find out more about that later.

The Original STFM. (Before dissassembly.)
^^

Inside the STFM we have the mother board, Tos 1.02/2.06, 4Mb Memory, High density controller module, one High density drive, T28 accelerator board, my personal mono/stereo bit's, PSU and the keyboard. An external high density drive was connected and took it's power and HD signal from the ST. (Added power port)

The Dissassembly.
^^^^^^^^^^^^^^^^^^

My first task was to check I had all the bit's with the new tower case. Then a hour or so looking at the diagram's in the manual, the text was no good to me. Once I had and idea of what went were and how, I started to dissassemble my STFM......
...... O.k. we have all the internal's of the ST safely on the table ready for reassembly.

The Keyboard.
^^^^^^^^^^^^^

The original keyboard is used to give a PC like free moving keyboard. The mouse and joystick still connect to it. The keyboard metal base had a interface PCB put into it for the connecting cable from the tower. The keyboard was pluged into the PCB and the plastic cover placed over the top. This was screwed together and the feet stuck on. This is the easy part of the kit.

The Main Tower.
^^^^^^^^^^^^^^^^ (M-B = Multi-Board.)

First the stand off bolt's were put into the base of the tower system and the mother board mounted on to these. Once the mother board was securely in place other connection's could be made.

The M-B was screwed into place where the internal floppy would normally sit. The power and ribbon cable were connected to this. The reset button was fitted at the front (The old one is left on the mother board.) It's wires were lead back to the M-B at the back. A wire was soldered near the original reset switch and was lead back to the M-B. The M-B can hold the computer for an extended reset on power up to enable a hard disk to start up.

The power supply was fitted into it's normal place after having the power switch removed and some connection block's attacked to the wires. The new power switch was inserted at the front of the case and the wires lead back to the connector block's and connected accordingly. A new metal cover was bolted above the PSU. The thermo sensor was attached to the metal above the PSU and it's wires lead back to the M-B. It's accompanying LED was wired across to the front and fitted. The M-B had all the wires connected to it. The thermo sensor not only light's the LED when the system get's to hot, but will also switch on up to 4 fan's to

cool the system down and will then switch them off again. Like the reset this is variable.

The floppy Drives were mounted in the Top of the case on stand off mount's and a power cable and ribbon cable connected between each and the M-B. To get drive B working I needed to solder a wire onto the Yamaha chip. However I could not do this as I have the high density driver module attached, but I did get the connection in the end. This wire connect's to the M-B. If you do add two drives make shore BOTH drives have the jumper set to '0'.

The keyboard socket was bolted into place next to the cartridge slot and it's wires taken across the mother board to the keyboard plug on the mother board. An earth wire was attached under a bolt holding the mother board down.

The T28 and Tos 2.06 have a switching capablility, one for 28Mhz/8Mhz, one for the cache and the Tos for 1.02 and 2.06. An LED was wired from the T28 to the front pannel to see when we are operating in 28Mhz mode, the cache work's on the fly so can be switched at will. As the front panel comes off I needed a way of connecting the switched with the ability of separating them from the system. Also I have my extra special sound system.

The Sound System.
^^^^^^^^^^^^^^^^^
What is it? Well, what I did was:
I removed all three sound channel's from the mother board and connected them to some ribbon cable. The switches were also connected to this ribbon cable. I used 25 way ribbon cable and a male and female low profile 25 way 'D' connector's. This mean's the mother board and front plastic panel could be disconnected easily.

The three channel's were wired to the front panel and through a switch, resistor and capacitor network which takes all three channel's and makes them mono for sampled sound's and put's channel A on the left, B on both and C on the right. This makes a faked stereo and chip music sound's great! The switch makes the change from mono to stereo and stereo to mono.

So in my boxes of bit's I found an old walkman PCB and 3 band graphic equalizer. The sensitive input's had to be grounded and the left and right were connected in the next stage of the amplifier. The output was connected to a large stereo jack on the front panel. (A lot of cutting to get the volume control, 3 band graphic, switch and jack was needed in the 3rd spare bay cover. The jack is a switching type. If you plug into it, it will disconnect the next stage. The next stage went back down the ribbon cable and terminated in a left and right speaker din. Two 2Watt speaker's were connected and the ground lines and +5Volt's

for the amp were wired accordingly.

There we have it a sound system that gives mono digital samples and stereo chip music. There is one hell of a difference when playing games, the music sound's alive and the graphic enables me to wind up the bass in those MOD files. Let's groove!!!!!!!!!

Finishing the system.
^^^^^^^^^^^^^^^^^^^^
The mother board is in place, all extra's have been connected, the front panel can be connected at will and the power supply and floppies are installed. Let's make it look like a tower. First I had the fun of putting about 20 little sprung nut's into square holes in the side of the internal frame. Once done the outer base section was found and the internal frame lowered into it and bolted together. A check to see that all was well was done and testing could start.

Connecting the power, video and keyboard left me fealing like I had missed a cable or two. Power up time. Apart from drive B not wanting to worked all was well. The High density module worked, the Toses worked, The T28 changed modes. Getting the sound system just right did take me a few week's.

To finish the system the top shell was bolted on (After I powered it down.) then the front panel was connected and slotted into place. Last of all was to stick on it's feet and there we have it a completed tower system. Plenty of room inside for a hard disk of two and other extras. An expensive upgrade? Yes, But worth every penny in my view. Hope you have enjoyed reading this and hay, get a tower get some space!

If you don't need the Type1-fonts, NVDI is the better way to go. Not only the
fonscalers are faster than SpeedoGDOS5 ones, but you have the overall VDI
acceleration as well.

>Custom Speedo drivers come with all major fax programs, and are a cinch to use.

NVDI allows you to create your own drivers easily with a nice tool. That's
very handy in case you have an "exotic" printer or want to add some special
features.

> Really, what's the problem?

No problem any more ;-)

Honestly, I don't know, Harry. I gave up my GEnie account about 6
years ago, and while I'm pretty sure Aladdin is still around in
some form, I have no idea to what extent Tim Purves is/was involved.

There is no MM for PPC. The *decision* about the PPC-port isn't even done yet.
Not to mention the actual development.

>(it also helps the the PPC emulates near 040 speed, which means itwould be several
>times faster than any Atari to start with

But the PPC-emulation lacks the physical PMMU, which is essential for MM.

>TT *today*.

I just got a CD-ROM disk called 'Yggdrasil Plug & Play Linux' it's for the PC world though, but maybe it is possible to set up something similar for Atari (and Amiga)
The CD-ROM contains a installation program to set up a complete Linux system, but you can also just play around at first without installing huge amounts of data on your HD, it just runs a little slower as all the data is coming from CD. Looks great and works great too, has some minor bugs still in it, but all in all it's quite easy to do. I rigourously deleted all the MS-DOS and OS2 stuff from my PCs HD and let the thing install itself.
It now boots up Linux straightaway and gives all the bells and whistles like X-Windows, C-Compiler, Emacs, Tex, Multimedia, Networking, CD-ROM support (hehe..) Communications (Full internet and BBS stuff included, UUCP, Fax)

If we combine the Atari and Amiga on one CD it should give Linux a massive push to become the 'next' OS for those 68030/68040 (and up) based home computers.

All in favour say aye !

687. clipart needed

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 03:26:08 UTC
From: thaanuj@CSOS.ORST.EDU
Message-ID: <3f4rsg$qoq@CSOS.ORST.EDU>
Source record: 173133

This isn't completely an Atari-related question, but the readers of c.s.a.st have been so helpful in the past, I thought I might as well ask here.

I need a couple simple clipart images for work. One of a peacock, another of an owl. There are so many clipart collections out there, I don't know where to start. I would appreciate it very much if one of you out there could email these images, or direct me towards a site that may have them. I know of the files at a.a, but they are so huge I can't take the time to download unless I have some certainty that the time won't be wasted.

I'm even willing to pay for them. The company I work for is building some custom plaques to be awarded soon, and all the images I've found so far are too complicated for my engraving machine to cope with.

Thanks!

*** PATCHING ROMS ***

Hi, I wish to put some patches into TOS ROMS 1.4 and 1.6 and 2.06,
what is the best software to copy these ROM's into a file...

I have used a debuger in the past (Raid) but some times it does not
work...

695. ST Upgrades No.2

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 09:40:56 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3f5hr8$69q@golem.wcc.govt.nz>
Source record: 173144
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Well this is a followUp to the Upgrades that I had to fix up..

These are the Marpet Xtra-RAM Deluxe and the AMITAR TOS 2.06 Upgrade..

Well After chamfering the pins on the header plugs so that they
would not damage the PLC sockets of the Glue and MMU, well after fitting the
Ram upgraded all was ok...

The AMITAR Doc's refer to a Automatic reset, but the logic is not
fitted, no mention of this in the doc's...

A had a small problem with a bent pin in one of the header rom sockets,
but with a help of a soldering iron you can replace a damage pin...

The BIG problem with the AMITAR is that you can't fit the shielding
back on, it will have to be cut were the HI ROM is and were the Glue is,
this is a REV. D type board, one with Blitter pads fitted...

I ran Gembench to se how fast TOS 2.06 was, all the GEM things were faster,
but the best one was only by 6%, the otheres were 4 and 3%, that being the New
Dialogs, 3 items only that is..

The Marpet RAM upgrade is well made, the AMITAR is not so good, but is simple
and does work...

The other BIG gripe with the Marpet was the clip leads used to pull up
4 resistors to disable the built in ram, these should never ever be used,
they can fall off and cause a short, I soldered a small piece of wire to
these resistors, then to the 5 volts...

So have a think before you rush out and buy these upgrades...

696. Re: 520ST to PC file Xfer?

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 09:42:09 UTC
From: wongck@lobby.ti.com
Message-ID: <wongck.86.0009B423@lobby.ti.com>
Source record: 173020

In article <3eqo5t$ofu@lucy.infi.net> joneil@infi.net (John O'Neil) writes:

Hi John,

> What is the best way to transfer files between my 520ST
>an PC? I've checked some of the FAQ's with no luck.

I am surprise that the FAQ does not have this information. It's is indeed very frequently asked.

Any Atari ST can read IBM formatted DD disk (720K). The best and probably easiest is just format a DD disk on the IBM and use it to do all your file transfer. This is easiest because you don't need any other software to do it. Make sure that the disk is DD and not HD as ST cannot read HD disk.

Another way is to get a formatter on the ST that formats to IBM standard. Most of the PD formatter program have these type of capability. Again only DD disk.

Yet another method is to get a ST program that will change the boot sector of a disk formated on the ST to be IBM compatible. Note that this only works for normal 720K format not one of those extended ones for 820K or 920K. There are some around, but I forgot the name. Check out aaue.

Yet yet another method is to get TOS 2.06 as it will format to IBM DD standard. If you get a AJAX chip and HD drive, you will able to do 1.44 Mb disk :-) on Tos 2.06.

>Also, my computer is a 520STfm. What does the "fm"
>mean?

fm = frequency modulator, that's to say you can plug it a TV into the RF out. This way, you don't need a monitor.

HTH

>PLEASE HELP!

Hi jones,

I am doing it everyday ... like I said try format a DD disk on an IBM. The DD disks are those with only one hole on the top RHS, that's the write protect hole. You need to use these type ... and they are somewhat hard to find.

If you are using a HD disk (those with two hole, top LHS & RHS) formatted to 720K, then you need to cover the top LHS hole. The top LHS hole is for auto HD detection. New disk drive have a auto density detector and will detect that it's a HD disk and start writting/reading in high density standard. All the IBM 1.44Mb drive behave this way. So your large data files are written to track/sectors that are not available to the ST drive which is a true DD only drive. If you recently changed the drive on the ST then chances are that it's also one of this type.

HTH ... it works for me until I got a HDD for my ST.

I don't know about decreasing the resolution, but if you installed Geneva,
you could use much larger system fonts which would be easier to read.
BTW, are you refering to a TTM 192?

I also have NVDI 2.51, and I asked William Behne about upgrading. He told me to contact Toad computers (for North America) or Systems Solutions (in the U.K.) It's my understanding though that version 3 is not faster than 2.51, it just adds the ability to use TrueType fonts with its GDOS. I've already got Speedo GDOS 5.00 which adds TrueType and Adobe Type 1, so I think I'll hold off of NVDI 3 for now.

703. Atari ST joysticks - help

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 10:56:11 UTC
From: waynlein@hk.super.net
Message-ID: <3f5m8b$618@hk.super.net>
Source record: 173148

Hard to believe, but in the computer heaven that is Hong Kong you can't find a nine-pin joystick to save your life. (Matter of fact, I haven't found another Atari user in Hong Kong - my local mail server techies don't know a thing about our machines - and the phone numbers for "Atari Hong Kong" have all been disconnected and reassigned.) Anyway, having newly arrived on the 'net, I've been active in the FTP process, have downloaded some games, am even going to pay the shareware fees - IF I CAN ONLY GET A JOYSTICK SO I CAN PLAY THEM!!! Anybody out there who has some in good shape, or who knows where they are still available by mailorder - your help is much appreciated. Please use my e-mail address to spare the bbs readers the need to wade through what to them will be boring info. Thanks. Wayne Leininger
waynlein@is1.hk.super.net

Neven Petrlik (npetrlik@public.srce.hr) wrote:

: Hi To All!

: Weird things are happening to my STE. One day, whe I switched my
: STE on, all looks normal - booting, loading the program etc ...
: But, after 2 hours of work, the bombs appeared. Maybe some bug in
: the program, or some acc mess the memory ... i thought ... I
: simply pushed the reset button, and then (to be sure)
: <Ctrl>+<Alt>+<Right Shift>+<Del> for cold reset. Then, it
: happened again! (20, 30, and once 80 bombs !!). I switched the
: computer off for 30-40 seconds, then on ... and then ... no
: picture, nothing ... i panicked ... and switch him off for couple
: of hours. Next day, i worked 2-3 hours, and all worked normally
: (no bombs). As I mainly use a hard disc than a floppy, this
: "worked normally" is a very relative notion. I needed to format
: one floppy disc (I'm using FcopyPro and E-Copy). I've set the
: parameters (in FcopyPro) - nr of tracks: 80 (0-79), nr of
: sectors: 9. Fcopy starts to format a disc, 79,78,77,76,75...
: 31,30,29,28,27... and then the message appears: The Floppy Disc
: Head Has Reached Track 0! I repeated the formatting procedure,
: but it happens again on the other track. E-Copy do the same
: thing. (floppy head has reached track 0 ... etc). This 'reaching
: track 0' happening occasionally (usually after a 1-2 hours of
: work).
: Friend of mine told me that MAYBE the MCU/GLUE chip have some
: 'bug'. I've look into the computer and discovered that MCU/GLUE
: chip is soldered (or glued)..
: Where is the problem ?
: Predator says that the disc drive is good (max. nr of tracks is
: 84 (00-83), max. step rate 2 ms).
: Floppy drive type is Epson.
: Also, when I'm scanning a perfectly good disc, Fcopy gives me an
: error message (on track>75, sometimes 77,78).. off course disc
: was formatted on this drive.
: As I mentioned, this thing with floppy happening from time to
: time, and the 'bombing' happened 2 days ago (several times) - not
: program fault for sure ... it happening in every prg ..

: Where might be the error ?

: Many Thanks.

: chip plus some RAM can decode MPEG in real-time while a high-end PC with a
: software decoder cannot.

Any MPEG cards going to be available for the Atari TOS platform then?

I agree, I just tried Kivi for the first time last nite & it's very well
done, and looks absolutely lush. I've only just started using QWK, so
I'm going to check out the competition before I decide to register it though.

Nope, a stock ST will handle a serial port of 19,200 but you will need a
serial port patch/driver such as HSMODEM. A fairly simple hardware
modification will also provide 38,400 too.

That's still 25 % more expensive than it is here. From what I've seen in the
last STR, it's more likely to be 160UKP after the introduction. (Which was
250,-- DM w. Ease over here.)

716. IDE drive & SVGA monitor

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 14:36:12 UTC
From: npbrown@coldogsoup.win-uk.net
Message-ID: <65@coldogsoup.win-uk.net>
Source record: 173013

Can anyone help. I have two queries.

1. I have a number of bare PC IDE drives at my disposal. Is there a company which sells the required hardware/software to enable me to use them with my 1040STE?

2. I have an SVGA monitor for my PC and an SM124 monitor for my Atari. Is it possible to use the SVGA monitor with the Atari? If so will it support all the Atari resolutions?

Many thanks in advance,

Nick Brown. Keep Signatures Small!

>
>Atari 1040 STF (inbuilt floppy drive, 1 Mb)

I far as i remember the F meant that the floppy drive was built in.. and the M meant that there was a modulator...

I have a 520 ST+, which is the same as the 520 st (no modulator, no inbuilt floppy) but with 1 MB. It has only been shipped in Holland, belgium and germany..

BTW the 130 ST was never shipped.... It was planned to be the smallest model but then the prices of the memory chips fall and they decided to ship the 520 st.

Message-ID: <3f6alq$fgn@bs33n.staffs.ac.uk>
Source record: 173017

Ok I am going to try my best to compile a FAQ for the Atari Falcon030, what I need is someone who can go to town explaining the hardware and such like that the Falcon offers. I am quite happy to cover all 'non techie' aspects such as software, clubs, companies, magazines and compatability.

So, if anyone wants to lend a hand then please get in touch, I'm not doing it all by myself.

722. GUI Interface

Newsgroup: comp.sys.atari.st
Date: 1995-01-13 17:28:27 UTC
From: rmccall@mcs.dundee.ac.uk
Message-ID: <3f6d7r$188@dux.dundee.ac.uk>
Source record: 173019

It strikes me that while the Atari has a reaonable to good range
of software what it lacks is a good, nice easy to look at GUI.
Did atari ever include a tool bar in TOS?

Simply add that and you instantly make things easier for us 'atarians'
and it also looks good, and may impress potential custmers.

Date: 1995-01-13 19:12:32 UTC
From: wells_s@kosmos.wcc.govt.nz
Message-ID: <3f6jb0$dal@golem.wcc.govt.nz>
Source record: 173025
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

] So I was wondering if there was any (easy) way to put in some switch that w
] disable/enable bank 1. Another solution could be a program like simmfix, bu
] would be reset resistant...

Could possibly be done, but the computer re-checks the memory after
a cold-boot and very few reset-proof programs survive a cold-boot (read,
none at all). SIMM-Fix will (should) survive a soft/warm reset
(Ctrl+alt+del or the reset button). I use a different program just
called "MEM" which does better checking than SIMMfix. All I do to
autoboot a game with 2.5meg, is to insert the boot-disk with Mem in
the AUTO folder, and then as soon as the computer resets after the
2.5Meg being initialised by Mem, I pop the disk out, and throw in the
one I want to use. And more often than not, it works fine.

I think the archive name is mem_2_5.lzh or some such thing, I got it
from micros.hensa.ac.uk anyway, just do a search for "2.5" or "SIMM"
or some such thing on there.

IMO, not unless somebody's crazy. While there are MPEG chipsets out there that make it fairly easy to design such a card, the market can't be too large. Especially bad is that you have to design at least two different cards if you want to run on very many machines; a Falcon card needs a much different design than a VME card for the MegaSTe/TT. Both exapnsion slots may also have problems keeping up high bandwidth, as the Falcon slot is dumbed down to a 16-bit 68000-like bus interface, and the VME interface on the TT and MegaSTe is also 16-bit VME, as I recall.

Cubase Audio does not do any low-level routines. The very big problem with some harddisks is that they calibrate. Any harddisk recording system doesn't like that at all. Steinberg Salescenter in Sweden (Fitzpatrick in Stockholm) recommend the Empire serie from 1GB -> ?. I recently bought a Quantum Prodrive 1800S 1.8 GB and it's works perfectly with over 8 tracks! You can even use a rather slow HD. The important thing is that it does sustain transfer.

From: sar@crash.cts.com
Message-ID: <D2DF19.CvL@crash.cts.com>
Source record: 173034

You can try two things:

1. Get a copy of DC Format. This will allow you to format disks for the Atari on the Atari and then when it's done, write an MS-DOS boot sector onto the disk so that it will read well on both machines. If you can't find DC Format give me a call <sar@cts.com>.

2. Format the disk on an IBM FIRST then use that disk on the Atari. The Atari's can usualy read IBM disks formatted at 720K just fine. But the reverse isn't always true.

If anyone disagrees, please feel free to correct me...

Good Luck! -Scott- <sar@cts.com>

From: lnonvei@public.srce.hr
Message-ID: <3f7bdn$c7n@nippur.irb.hr>
Source record: 173035

Hi everyone!
I have AT-SPEED C16 wich works fine in MEGA ST, but I want to use it in my
MEGA STE. Manual don't say a word about AT-SPEED upgrade in MEGA STE. It
only says that 1040 STE need some PC-Adapter (???).
Does anyone know is it possible to use this PC286-16Mhz emulator in MEGA STE
or at least 1040 STE (without any special Adapters)?

MANY THANX.

Loris

741. FS: Atari 1040 & 45meg Supra Hard drive

Newsgroup: comp.sys.atari.st
Date: 1995-01-15 01:19:05 UTC
From: tkk@uclink2.berkeley.edu
Message-ID: <3f9t69$122@agate.berkeley.edu>
Source record: 173042
Cross-posted to: comp.sys.atari.st,comp.music,alt.music.midi

I have an Atari 1040ST with a Supra 45meg harddrive for sale. This is perfect for a MIDI setup. It's a pain to do MIDI(or anything else) without the speed, and convenience of a harddrive. The hard disk comes in a "shoe box" type case with room to fit another hard disk and adapter. I haven't had a single problem with either the ST(TOS 1.2) nor with the hard disk. I am selling because I've just bought an Atari MEGA STE to do all my MIDI stuff. Send email to tkk@uclink2.berkeley.edu

P.S. I don't have a monitor to sell, but Atari Mono monitors go for around $50-$100 used. Check comp.sys.atari.st.

Hi Lars,

LR>Cubase Audio does not do any low-level routines.
Of course it does. I've had a client with an Empire 1080, which must have inititator identification when being selected. The drive just says 'I do not work with an initiator which does not say, who he is', so there is no reaction of the drive.

With a patch to AHDI, the drive works fine, but with Cubase Audio there was no accesss to the drive at all.

Then I disassembled Cubase and did the (almost) same patch as in AHDI and since then it does work fine.

Ciao, Steffen

Since I'm the one who started the query, let me answer the points:

>Do you want just a viewer that can view that HTML pages that you are
>down loading, E.G you don't want to view them and be able to click on
>the links and go to other links. What i mean is do you just want a

I can d'l the pages via a server. I'm not aware of linked-pages being sent
automagically as well. So a viewer for single page would be fine for _me_.

>viewer or a browser as well??? If you only want a viwer do you want it to
>display the .GIF pictures???

It doesn't necessarily have to have a gfx-viewer (or sound player or whatever)
included. It'd be enough to pass-through any image/sound/whatever to another
application, e. g. another TTP.

And a TTP-version of the WWW-HTML-viewer would be alright as well. At least
for starters ;-)

Do you have s. th. on your mind? It kinda sounds like it ;-))

>>: details on the pricing of this?
>>The price is 300,- DM.

Including EASE, that is.

>Gee I can buy a real OS (Warp) for 1/2 that price here.....

Oh, c'mon on. The market for Warp is 100.000 times larger than the prospective
market for MagiCMac.

IBM doesn't _have_ to make money with the OS. They *want* to penetrate the
market as deeply as possible. No matter what it'll cost to achieve. The want
to kick MS into its Wondoze-butt.

What do you think why they made a huge public announcement of stopping their
Pentium deliveries? Just another marketing blow against Intel/Microsoft.

Money can be made later with more sold applications or services.

IBM gets loads of money for their works in Ireland (or was it Scotland? Dunno
exactly). This is a very badly developed area (business and work wise). And so
the EC pays the companies to come to those areas. That is a major factor in
the calculation.

ASG doesn't get any of this. And they're such a tiny, little, small,
unimportant company compared to Big Blue. They _have_ to make a living from
their business.

>Way over priced, note, people out side Germany don't get near the same
>wages....

Perhaps time for you to move again, he Roger?

So straighten out your facts (as you want us to do it) before you open your
cakehole and babble all over the net.

Good 4 U. BTW, in which size?

>>The MedusaT40 can handle something like 11 frames/second.
>A well coded 68040 mpeg player should run the same speed as a DX2-80/dx4-100.

There is no 68040 with that clockrate. At same speeds, a Pentium is faster
than a 040.

>a 16 Mbyte partition. I eventually fed it the size (-b option) & got a 120
>Mbyte partition.

>The documentation mentions problem with drivers, but AHDI should be o.k.

I had *MAJOR* problems with it!

I looked through the doc's and tried to make a 160mg minix partition. The
partition was empty to start with and the minit program took a long time
doing whatever it does.

It said that you may need to reboot for the changes to take effect so I did.
Then disaster struck!

I was running mint at the time. Whenever the machine tried to start
(using Ctrl+alt+del, ctrl+alt+del+shift, reset button or even switching
it off for around 5 minutes!?!) the display was mangled. There were
various colours all over the place. It would usually lock up completely
soon after the memory check. It was different every time. The few
occasions it got as far as trying to load mint, it said PMMU already in use.

I eventually managed to get to the desktop and un-minix the partition
(which I thought was the problem). This didn't make any difference. I
gave up thinking I had knackered my falcon and left itover the whole
weekend. I tried it this morning and it *seems* OK.

The machine is a 4meg Falcon TOS4.04, Mint 1.12, NVDI2.5, blowup. The
minix partition was half a 330mb SCSI drive. Everything was working OK
until I tried minix. The trouble is I think I need minix to get mint-net/X11
to work.

Any ideas what I did?

752. FAX

Newsgroup: comp.sys.atari.st
Date: 1995-01-16 19:53:31 UTC
From: vsnyder@math.jpl.nasa.gov
Message-ID: <3feirr$p8r@netline-fddi.jpl.nasa.gov>
Source record: 173053

My brother has an ST 1040. I think he's running TOS 1.0. He wants to attach a FAX/data modem.

What do you recommend in the way of reasonably priced FAX/data modems, in the 9600 - 14.4k range? How does one contact suppliers (most of the Atari stores in our area are belly-up).

What do you recommend in the way of PD/reasonably priced FAX software? He's still using First Word! Is there FAX software that'll work with that? I had some PC FAX software that intercepted the print request and routed it to the FAX, but it required you to pretend your printer was some flavor of Epson, no matter what it really was. Of course, when you receive stuff, it's important to be able to print it, and at that point, you can no longer pretend to have a different kind of printer. His printer is a Star B-10. (BTW, he never got a screen dump to work with that printer. Is there software for that now?)

I recommended Uniterm for the data section of a modem. Is there something better now? As I remember, Uniterm was pretty good.

He wants to do the whole thing for under $150, because he's found a FAX machine for that price. But he'd rather not print stuff just so he can shove it into the FAX machine, and then throw away the paper.

Please e-mail replies, and I'll summarize if there are any, and there's interest.

I would recommend a US Robotics. Thats what I use. You can mail order a sportster 14.4k Fax/modem for $108.00 from computer discount warehouse at 800-726-4CDW (the 28.8k is $208.00). As far as fax software goes, I don't have any yet. I have seen all the Terminal software on the ST and I use the Freeze Dried Terminal v. 2.20. It the best in my opinion and its shareware.

> and I'll run some tests. >:)

I was experiencing with getting highers frequencies to VIDEL, and on two diffrent Falcons I achive 68MHz. It works without any bus speedup and the system is slower a bit (up to 10%) but I noticed that it depends on vertical refresh rate (I suppose that simply the VBL interrupts routines are slowing down the system). Anyway value of 68MHz is quite strange (of course it works on 1-4 bits and for 8,16 bits I'm able to set clock on 34 MHz), however the limit is very noticable and it doesn't depend on clock. Anyone have an idea, why such value?

regards,

Simon.

763. Word processor Atari 1040 ST ?

Newsgroup: comp.sys.atari.st
Date: 1995-01-17 10:33:07 UTC
From: Ton Martens <martens_ton@tandem.com>
Message-ID: <D2JpB8.6u1@tandem.com>
Source record: 173064

Hi all,

Since I only use my ST for MIDI, I'm not very up-to-date about the
latest software...
I'm looking for a nice WordProcessor that will run on a 1040ST with
1 MB, TOS 1.4 and a Harddisk (HighRes Monitor).
I'm familiar with PC-Windows wordprocessors (Word for Windows), and
I think these are great. Is there something simular for the ST
nowadays?

In summary, I'd like to receive some info about nice WordProcessors
for the ST, commercial and shareware packages.

Thanks,
Ton Martens (martens_ton@tandem.com)

764. anyone using atari 520?

Newsgroup: comp.sys.atari.st

Source record: 173081

A > Friend of my has an atari 520 and would like to connect it to a
A > keyboard via midi.

If you don't have 1 megabyte or more of memory then you probably won't be
able to use MIDI.

A > We also would like to transfer some atari files to PC. I think
A > there is a utility that would make the atari write to a pc disk anyone
A >

The Atari ST can write to a PC disk, if you put a formated PC disk into
an Atari disk drive, then you can write too it (in most cases). To
create a PC format disk with a pre-TOS 1.04(?) you'll need a disk formating
program that supports PC formating.

Hope this helps...

Kim Andersen (kim@dksoft.ping.dk) wrote:
> Looking at it from the developers point of view, i only spot profit.

What's wrong with trying to make profit in the Atari market? The market
is small, and it's dwindling, so I can't blame 2B for their decisions.
To the contrary, I'm glad they're still there and pumping out software
for our computers.

> I know there is alot of of ST owners out there, but what is the idea in
> getting/creating a new computer if it isn't going to be supported with
> software.

It's not the developer's job to create the market for a new computer.
Why should a developer invest considerable effort into the Falcon
market if not even Atari really supports it?

> And if you keep on suporting old (outdated) computers, you'll
> end up beeing the loser, as people will start seek other alternatives,
> (why do you think so many people has left the atari platform ?).

Because Atari was too late with the TT, too late with the Falcon,
and did not build on their strengths as they should have. In retrospective,
virtually nothing happened at Atari during 1985-1989 in terms of
system software and new (released!) hardware.

> Atari co. made the Falcon more than a year ago. Look at the lack of support
> it's getting, and start wonder why it doesn't sell that good. I blame
> Atari Co. as well as the developers and the programmers for this.

When the Falcon was released, the Atari market already was in a very
bad shape, and many developers were looking for alternatives (including
yours truly). The disappointing Falcon support was the consequence,
not the cause of the demise of Atari.

And, BTW: I generally don't buy the hypothesis that it's the developers
who are at fault. The bulk of the problem lies at Atari, nowhere else.
In 1985, they had a system which was better than everything else on
the market, both from the system software and the hardware point of
view (well, the Mac had a slight edge in software, but not really one
which justified its price tag). The hardware was fast and well designed,
featuring things you couldn't get anywhere else (the 640x400@72 Hz
display on an ultra-crisp monitor; DMA for floppy and hard disk
transfer; a load of built-in interfaces; MIDI support...). The
software was ahead of its time, and GEM seemed to become the de facto
UI standard even on the PC. Atari just didn't follow up, and
the competition didn't sleep.

To sum it up: I do understand why the lack of Falcon support upsets
you. I would probably feel the same if I had a Falcon. But on the
other hand, you have to understand the people who are still in the
Atari market, trying to make a living from their work.

What's so hard in putting mint.prg in your AUTO Folder, minix.xfs in a
MULTITOS folder, reboot and than call minit - that's all you have
to do to get minix partitions.

O.k., that stuff isn't plug play, but why not try to handle it?

As you probably know, there is an X11 port for MiNT-Net available in
the net, even with some Xlibs.
So I did get me the Mosaic-2.4 sources, edited the Makefiles a little bit
(really little) and tried to build it.

Result: most of the stuff for a small installation is compiled, the
whole failed IMO, because the Xm-lib is missing. When I get
it, the works continues.

The BMS-100 of 1988 vintage I used to use (and which my brother in law is
now using) was designed to run with BMS driver software (INSTALL.PRG,
SETCLK.PRG etc) in the Auto folder on drive A. It seems that it is
simply behaving as it would have done "out of the box". BMS sold the
adapter coupled with the Adaptec controller as a package, so perhaps there
is a compatibility issue with the Emulex adapter?

The quick flash or 2 from the drive light is a start... this happens as a
consequence of the ST checking for devices I believe.

(I note from the BMS-100 manual that the adapter supports a _subset_ of
the SCSI command set).

The manual does not offer a great deal more info on matters other than
the BMS-100 and its "recommended" controller the Adaptec ACB-4000 (which
of course is for ST506/St412 drives). However if you need to know what it
does say then mail me at chrisw@perth.DIALix.oz.au.

Chris Whitelock

PS Perhaps Berkeley Microsystems are still at US tel (415)465-6956?

I was unable to get MacPPP to work on my Atari Mega ST 4 with
Spectre GCR. It cannot see the modem port (greyed dialog in Control
Panel document). Before trying with InterSLIP I would like
to either have System 7 working on Spectre (high hopes) or
find a System 6.0.5 compatible Mac WWW browser.

HD disks need a stronger signal to write them. Older drives can't quite manage it. Obviously an HD drive will write perfectly as will some newer DD drives (like mine).

In fact many of my disks are HD's are formatted to 84x11 (=935k) but don't do it yourself unless you fully appreciate the risk.

Has anybody of you atarians seen slipknot on PC+MSDOS+WINDOWS.
As the name suggests it doesn't need SLIP, it just uses a login
at a UNIX-host wich has lynx and gives about the same as Mosaic
or Netscape! Why could that not be done on an ST+TOS+GEM ??

> : A: to load something. It just sits there until I shove in a diskette

This sounds like a problem I had when I first got my Supra adapter & found
that the the HD would not autoboot.At the time, I was using a setup like
this:

Supra Adapter---> Xebec SCSI to MFM adapter ----> Old PCtype MFM Drive.

I could autoboot from the floppy, but not the drive.
The problem was solved when I used SCSI drives, but I remember reading
about some old drives not having the capability to autoboot, or the MFM
adapter would not be able to boot.

I seem to recall a song which mentioned Atari in the lyrics. I think it was the bloke from Beats International with some other geezer, it was a version of Blame It On The Boogie. The line in question went something like 'wait 'til I reset the Atari'. I've got it on some compilation album at home so I may be able to confirm this later...

796. Mupfel

Newsgroup: comp.sys.atari.st
Date: 1995-01-18 15:04:31 UTC
From: forden@antelope.cs.man.ac.uk
Message-ID: <FORDEN.95Jan18150431@antelope.cs.man.ac.uk>
Source record: 173097

I've been trying out the Mupfel shell recently to see if it provides me with the capabilites I'm looking for. So far it seems pretty reliable, however, I was wondering is it possible to use '/' as directory separators, or must the default '\' be used. I know this may seem like a trivial gripe but old habits are hard to break.

Thanks in advance,

Nick.

: And just what would you want this 'tool bar' to do?
: Do you mean something like the 'Desk' menu, where we can load any
: 'tools' (accessories) we like? Hey, just a minute - bloody hell, what's
: this at the top left of my screen.....

By a toolbar I mean a graphical menu which has all the most used options
for that program, availble simply by clicking on that button. For example
in a worldprocessor things such as underline, bold, jusfity, load, save
, print. That sort of stuff. Yes sure a keypress is faster but when you
compare the GUI with Windoze you realise that small things like toolbars
make quite a bit of difference.

: access... Can no one give me some idea of what to do here.
Probably because not many people _have_ a LaserWriter they're trying to hook up to their ST.

Anyway, all the system installer (for 6.07 at least) does is copy files to your system folder. Assuming that your LaserWriter driver is completely unarchived, you should just be able to copy it to the System folder, and everything should work fine. Assuming of course, that's where it's supposed to go (put it there if it's System Document or some such type).

799. Apex Media Software

Newsgroup: comp.sys.atari.st
Date: 1995-01-18 16:41:06 UTC
From: ac382@freenet3.carleton.ca
Message-ID: <D2M10I.7tu@freenet.carleton.ca>
Source record: 173100

I have been playing around with the oficial Apex Media demo and
have to say I am quite impressed. The speed of the image loading is
excellent as is the interface. It is a snap to jump right into the program
even without a manual. The most impressive feature is the morphing studio
which is very easy to use and quite fast for the results it gives IMHO.
The program works flawlessly on both RGB and VGA monitors. Apex starts and
exits perfectly from any Blowup rez.

I think this program is a must have for any Falcon owner who
doesn't have a decent art package. If you have a Falcon and haven't picked
this demo up yet I highly recommend you do so. The ZIP file is ~550K and
can be found on micros.hensa (ftp/www).

ROTFL.

What and from whom? Di you think a complete OS just falls out of a tree or something? Thats a lot of manhours in there.

>HM> Claus' is 100 % right. Period.
>Thats your opinion, and not mine.

Claus' nows the situation better than both of us. He's done a lot in the ST-scene a couple of years ago. He has the inside-look, we do not have.

>HM> Nonsense. NVDI isn't part of Mag!C.
>If it isn't, then Magic isn't as good as they claim it will be.

You are referring to "they". Who are "they"? I haven't seen _any_ *official* statements about Mag!C3 from any of the folks related to this project. Do you? Nah, I don't think so. And I've even talked to Winfried Behne a few times over the last couple of weeks.

>HM> There are no "new" computers made by Atari any more. Only Games-consoles.
>The Falcon is indeed newer than the ST.

The bird is newer, all right. Still outdated, though.

>HM> That's at least 3 years ago. And it was outdated the moment it hit the
>Not true. If you cared to look at Cubase Audio, you'll understand what i

Do you think a 16MHZ 6030 is still state of the art? What has CA to do with a hardware being modern and up to date?

>mean.. With Steinberg yout have exactly what i'm looking for, people who
>really support the machine.

Tha has nothing to do with the outdated hardware of the Falcon. Sure, lots of great software is available.

>But you probably prefere we stay with the good old ST, which in your opinion
>is not outdated. To be honest, i can't really follow your meaning.

???

I can work satisfyingly with my MegaSTE. Sure it is outdated. So what? I was not he one whining about no further developments from Atari. And I most certainly won't buy _any_ Atari-clones as well. Too expensive.

A decent PPC-equipped clone with PCI-bus, built under the CHRP-specs will be
my choise for the future.

>reading a german mag make me very European & liberal
>- unlike the rest of us ignorant englishmen :)

Well said ;-)

>Anyone care to suggest a good german mag to subscribe to ?

The only _decent_ mag is the ST-Computer:

Subsciber's service:

PSH Medienvertriebs GMBH
Georgenstrasse 38b
D-64297 Darmstadt

Phone +49-6151-947723
Fax +49-6151-947725/947718

Price within Germany 80,-- DM/year, Europe 130,-- DM/year. Air-Mail to other countries 238,-- DM/year.

And there is the newly formed Atari-Inside, but I wouldn't consider this mag as a decent one.

809. How connect MFM HDD to STE?

Does anyone know how to get past the bear in the forest time zone in the Falc version of Ishar III? I don't feel like killing the poor guy (besides he's pretty buffed).

By the way I did try it with everyone wearing fur (which look like bear suits ;-). Do I need a spell? Does anybody have any clues as to wear the cauldron is? And where is the theatre?
Thanx!

Same here. I've used Word Up, Word Writer, and of course First Word (Plus). All or too limited and too slow. Others I've seen look like something you'd see running on an 8088 IBM.

If anybody knows about a full GEM program that likes Magic!, please pot here or e-mail me.

Wouldn't this MacPPP be too slow on an emulated 68k-MAC anyway? MOSAIC is a
real memory and performance hog.

A doubt there'll be any MAC-Emulator running System 7 at all.

But how can I buy Imagecopy 3.52, Last time I heard it was only at 3.51
and they didn't have it in the USA yet. I would love to get this program.
Also how much is the price for it. And where can I order it from?

the falcon xbios provides sector level TRAPs to read from scsi devices, the
xbios routines are called something like DMA_Read / DMA_Write, I think these
have been present since TOS 1.6. See the Atari Compendium for precise details.

820. Atari ST for sale!

Newsgroup: comp.sys.atari.st
Date: 1995-01-19 02:25:17 UTC
From: lombardo@herbie.unl.edu
Message-ID: <3fkiid$gb9@crcnis3.unl.edu>
Source record: 172970

For Sale:

* Atari 520stfm, 8 Mhz, 2.5 megs RAM, DSDD Disk Drive.
* SC1224 Color (RGB) Monitor
* Seagate 85mb hard drive in shoebox case with power supply and ICD SCSI adapter with built in clock.
* Beetle mouse (GREAT mouse)
* 1200 baud Hayes compatible modem
* Tons of software on the hard drive including Word Writer ST, Word Perfect 4.1, PageStream Desktop Publisher, GFA Basic 3.0, Gen ST (developers version), several pd terminal programs
* ST Replay sound digitizer with ST Replay 5 and 4.1 software

This computer has lasted me over 6 years. I hate to give it up because it is still a great system but I simply need to sell it. It is more capable than any mac classic and even most pc systems around and can still out perform them. It is a great word processor, desktop publisher, terminal, game system, and computer to learn programming on.

With the system, I will include all of the manuals I have on programming it in Assembly, C, and Basic. I have many of the Abacus books as well, including GEM Programmers Reference, Tips and Tricks, and ST Internals.

The best offer I receive will take the whole system.

Thanks for your time!

Well, ya can't bring 'em round 'cuz I'm in NY - BUT - why not just borrow or
rent a IBM clone type parallel port printer? The 1040ST will output to MANY
Epson 24 pin on my Mega 4 right now! That
seems a lot easier than transferring all the files!

822. Upgrade path for my STE

Newsgroup: comp.sys.atari.st
Date: 1995-01-19 08:51:53 UTC
From: zap@eskimo.com
Message-ID: <D2n9yH.lz8@eskimo.com>
Source record: 172972

I have had my STE for several years and want to give it a new feel. I mostly use my system for telecommunicating and playing games but don't want to lock myself out of using MIDI applications down the road. I would like to purchase an accelerator either by AdSpeed or will consider others. I also thought about getting the 2.06 TOS since it would be easy to install on the STE. I admit to being completly confused about the differences between Geneva, MultiTOS, Mag!x, NVDI, and Warp 9. I want to be able to multi-task my telecommunication program and run compression tools at the same time such as arc, zoo and the like without crashing my system. I have 4 megs of ram which I rarely use but would like to sometime. I guess what I am asking is that if you were to contemplate upgrading your STE, what combination of elements would you use to get a faster, multi-tasking computer? I have Neo-Desk 3 installed and like it enough to upgrade but would consider another desktop if the icons had at least as good look with similar capabilities. In short, I want to play with my system, not sell it. Any help would be very much appreciated as I want to get the most for my upgrade dollars. Thanks in advance.

But Warp doesn't run on the Acorn :-) On a side note, what does run on
the Acorn, Roger?

: >Way over priced, note, people out side Germany don't get near the same
: >wages....

Why would someone want to live outside Germany? (joke, joke) The fact, that
Germany
has higher wages than most of the other countries, shows that the
"teenagers" there work more seriously than some old guys, who cannot
afford DM 300 for software (well, Roger, people may know why you get less
paid than others).

Besides, why don't you throw your Atari away and get yiurself a decent
Acorn or whatever?

Regards,

Alfred

Nope, I am definitely using 2.2b....

Maybe it's Blowup? I've noticed a lot of programs will not run in the
"custom" modes.

Anyway, it doesn't matter too much now,
Phil

Check out Atari Works (Copyright Atari Corp.) - this uses toolbars with
functions
like bold, underline, centre etc. in the word-processor and others in the
spreadsheet etc.

The lack of toolbars in programs is partly to do with Atari not making it easy,
but also that the developers for not having a go (IMO)...

Anthony

>--
If this is the case please can you tell me which TOS/BIOS/XBIOS call I
should use to send a 6 or 10 byte Command Descriptor Block (CDB) to my
scsi CD-ROM to start playing a music CD. The answer unfortunatly is that Atari
did not provide a low level interface to the scsi chip, so all suppliers of
scsi devices have to write their own interface ie Hard Drives (ICD etc)
CD-ROMS (Metados, extendos), Tapes (Gemar). Atari should have provided
an XBIOS call similar to: int scsi_cmd(struct CDB mycdb, int *buffer).
We then would have had a consistent interface to scsi devices.

Message-ID: <790535822snz@bigbox.demon.co.uk>
Source record: 172906
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Could someone either tell me a fast site where I can ftp mh-mint112h2 from,
or upload to to hensa or atari archive?

Last night tried to ftp it from tu-dresden, but had to give up after three
quarters of an hour after only having recieved 60K (around half). I was
getting a throughput of 30cps - which isn't funny when you do it by phone
as opposed to a straight link :-(

Also, I have been told that there was a project to write a version of GEM
AES for MiNT, either as a free or as a shareware product, but that it has
been dropped because of lack of time. Apparently a large proportion has
been written already. Is there any chance of someone picking up the
development of it again or have we seen the last of a great idea?

There's no difference at all between atari and amiga for standard joysticks.
But these days finding that type of joystick is difficult even in the UK -
most that you see now are for the PC (15pin D connector, analogue), or for the
consoles which (apart from the Sega master system) use their own connectors
for joysticks.

>And probably some other gumph which I can't remember right now.

Hardware scrolling, which is used by a few games, and by virtual screen utilities. The later TOS (assuming its an early model ST), the blitter and the sound are worth paying extra for, but not much extra and if James can get this system really cheap it probably isn't worth him holding out for an STe that may be quite a bit more.

>: Is there any
>: software/games that are STe specific? I never had opportunity to use a STe.

>Some, I think there are new games coming out early this year which are STE
>only but how available they'll become is anyone's guess...

Obsession is STe (or falcon) only, and I think Zero 5 might be. Both these should be available now,

Well, I guess the best quality would be a result of - first resizing the
.JPG to 320*y or x*200, matching the aspect ratio of the original picture.

GEMView should serve for this purpose :-)...

And then add black borders and/or use a program that does this all on its
own and convert it to .SPC. (DMJ-GIF or similar, is there a pbmtospc in
the PBMplus package?).

Source record: 172984

ST Assembler is a WWW page that I'm working on at the moment. It will contain all the Atari ST/E hardware details that I can get hold off, and will contain at a later data Assembler code to demonstrate the use of the hardware.
I will be adding most of the information over the next few days, and then the source code bits over the next week. (Well depending on how fast I can type anyway).

The very small and no yet html'ed ST assembler can be found at:

http://www.bath.ac.uk/~py4sdh/index.txt

If anyone has any questions or want to donate info, articles or source code you can email me at:

py4sdh@bath.ac.uk

>Isn't this what unix2dos and dos2unix do? (Or am I missing something?)

Yup, it does it all in one program though...

flip -m foo.txt will convert foo.txt to DOS/Atari end-of-line format.
flip -u foo.txt will convert foo.txt to UNIX eol format.

There's probably an option for Mac eol format (a line-feed), too, but
I've forgotten.

C++ doesn't take much more:

```
String a = "foo";
String b; // Ok, ok, so you have to declare your vars...

cin >> b;

a += b;

cout << a;
```

>Of course, once you've understood what strings really are, and even
>more once you've run into performance problems due to the garbage
>collector, you'll realize that "the C way" has significant advantages.

A guy I work with is constantly whining about C strings and pointers in
general; he likes PL/1. ;-)

>My point is: BASIC isn't just C in a nice syntactical wrapper; it
>offers features which make it suitable for a beginner who
>never wants to get into the fishy details of programming. For
>everyone else, however, C (or just about anything else but BASIC)
>is, IMHO, the better choice in the end.

It all depends on the project. If you're just whipping up some simple
prototype, BASIC can be great. C or C++ (or whatever) would probably be
a better choice for implementing the whole program.

The bottom line should always be "use the best tool for the job".
Unfortunately, programmers aren't always managed by people with a clue,

and corporate politics may creep in decreeing one language over another.

>GFABASIC is a very hideous flavor of BASIC. It has a very fast

No, he means a bunch of buttons/icons that you can press for
commonly-used actions; they're quite popular on Mac and Windoze and OS/2
applications.

These toolbars usually live at the top of an application or document
window.

Well, I don't know what dmm56 is?
Silly questions... Have you used the setups in the Spectre program page for
serial printing, etc? (I'm going on memory here, I don't have the manual
beide me). What about pressing the help key when in mac mode and checking out
serial communications, etc.
I mean, an Apple Laser Writer is set up to run serial, I assume you have the
physical connection down, and Spectre set up for serial, so why do you need
dmm56. I need more info

Hi there, I'm just statuating a simple fact! I'm sorry if you've got big
problems. I think the reason that I can run a Prodrive 1800S is that my Falcon
is totaly re-build, a 40MHz processor, all the audio bugs fixed, the synk fixed
etc.. Even if I run Falcon in Slow mode (25 % faster than the original 16MHz!)
it works just fine. Sometimes I get a 'Harddisk to slow' but it doesn't do
anything to the actual recording!! I don't use the Falcon for anything else but
Cubase Audio and some synthesizer editors. I use my 486DX280 for all the good
work :)

/ Greetings Lars

Tell me what home machine do you know that can do Multi-Processing
and Runs PC software has a 1.6 meg floppy and is 6 times faster than
a 486 2-66 in handling Graphices..

I think you can stack up to 7 processers...

There is a Advert for one on Page 31 in ST-Review Nov 94....

> Can anyone tell me if it is possible to disable the font
>abilities of NVDI 3.x without disabling NVDI?

All Speedo- and TrueType fonts in HIDE directories won't be used by NVDI3.
However, the scalers will always be in memory. There is no way to prevent
NVDI3 from loading them.

>I would upgrade my
>2.51, but I'm not a real fan of *having* NVDI load the fonts when
>I want to conserve memory, and using SpeedoGDOS and NVDI 2.51
>works fine in that case. Any help much appreciated.

It depends on what you need. If you don't need the vector font capabilities
very often then stay with NVDI 2.5 (NVDI3 is not faster) and SpeedoGDOS
(v5.x strongly recommended in this case).

If, however, fast vector font output is what you want and if Type-1 fonts
aren't important for you NVDI3 is the better choice IMHO.

>Anyone know where I can get concise instructions on setting MinixFS?

Try to find the source code of minixFS. The archive contains a description
on how to set it up.

>If anybody knows about a full GEM program that likes Magic!, please pot
>here or e-mail me.

Papyrus. There's a standard version and the Gold version.

The standard version runs with 1 MB RAM and uses GEM- and Signum bitmap
fonts for screen display and for printing. Except the usual features of
a wordprocessor (automatic text formatting, hyphenation, drag&drop of text
blocks) it has some extras such as discontinuous blocks and simple graphics
objects (lines, rectangles with various line and pattern styles). Including
and scaling of bitmap images is no problem. The display is WYSIWYG and you
can work in any zoom mode you like (20%....5000%).

The Gold version needs 2 MB RAM and it gives you some DTP-like features, such
as excellent creating/editing of tables, free page layout, GEM-metafile
import (vector graphics) and many many more.

Both versions are full GEM programs (and they like MagiC) with an excellent
user interface (nonmodal dialogues). They will also use vector fonts if
NVDI3 or SpeedoGDOS are installed (2 MB and harddisk required then). Either
version can be upgraded with a spell checking module.

Papyrus v4.0 is expected to appear in March/April '95 supporting colour
images and AFAIK the unicode standard for character sets. A first beta
version of Papyrus for OS/2 shall be presented on the CeBit computer
fair in March as well.

There are other word processors (using GEM) as well, such as That's Write,
1stWord 4.0, Tempus Word (German), Script (German), Signum3 (German) an I've
also heard of a new program called Gut'nberg. I don't own these progs, so I
can't tell anything about them.

Hello,

I am writing some game and was wondering how to read (in C) the arrow or cursor keys. Now I use the numeric key pad but I want to use that for something else. I tried to read and echo these arrows but all turned out to be 0. Is there some other function I should use? Something like reading alt/ctrl etc..?
Thanks in advance, please email to bike@xs4all.nl or post in this group.

Bert.

856. AstroPanic94! rev. c.

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 04:08:58 UTC
From: dackerma@magnus.acs.ohio-state.edu
Message-ID: <3fnd0q$mp7@charm.magnus.acs.ohio-state.edu>
Source record: 172912

AstroPanic94! rev. c. is now on atari.archive.umich.edu, under
Games/Space/p94_revc.zip. This file only contains the program and the
graphics. A seperate file in the same directory, original.zip, contains all
the sound files. And there are numerous more sound files. Several small bug
fixes have also been applied.

There is also now a "Select Sound Set" button that lets you select a
different set of sounds for AstroPanic to use. Alternate sound sets can be
located on any drive. This also allows for floppy based systems to put
the sounds on a different disk than the game.

For those of you who don't know. AstroPanic94! is a small shoot-em-up
that runs in any planar video mode (i.e. 2-256 colors) any resolution and also
supports DMA sound. It runs on video cards, TT's, Falcons, Mega's etc.

Registration is only $5. And get's you a registered version with 2
additional Ufo types.

For more information, or comments or bug reports.

863. Parallel port

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 08:05:06 UTC
From: richard@stingray.manawatu.gen.nz
Message-ID: <FAUUEAUYUp@stingray.manawatu.gen.nz>
Source record: 172909
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Does anyone know the difference between an ST's centronics parallel port,
and a PC's?

I thought that the PC is supposed to be bidirectional, but not the ST, but
this is not the case, as I can send data out of the port quite happily.

Perhaps there are some extra pins used or something? Maybe these were
added to the Falcon, as I remember reading that it was coming out with a
bi-directional parallel port - yes "coming out" - it was an old mag.

Also does anyone know the max transfer rate for the port? And does it use
a PIA, or some other chip?

Any help would be appreciated, as I am (have) wired up a cable and
semi-written some software for transferring files between my ST and my 8bit.
As soon as I have finished that, I then need to write a PC version for some
friends.

Thanks,
Richard =8-]

its the PSG soundchip port B data, and strobe and busy are bits in port a.
the max transfer rate shall depend on the clock-cycles, may be a 10th of 8MHz

> Any help would be appreciated, as I am (have) wired up a cable and
> semi-written some software for transferring files between my ST and my 8bit.
> As soon as I have finished that, I then need to write a PC version for some

well i tried that too with my ST and my C64 but i seem to have problems with the
voltage-levels, because my st doesnt seem to get the data bits ...
the GEMDOS (or was it BIOS) call to feed the PSG might can send but not receiving ...
i recently plugged a led to the strobe pin and was surprised that it seems to be
always on high ... |: (not even cycled)

i would appreachite too some advices ...

From: fvkampen@cs.vu.nl
Message-ID: <D2pBHr.2qE@cs.vu.nl>
Source record: 172923

Hello,

I backed up my hard disk using Fcopy Pro. I know it is not the
most advaned program in the world but It is sort of simple.
BUT, When I reformatted my Hard Disk and wanted to place everything back,
it gives a 'Write Error on Partition D' error. (Hard disk is fine, no problems
no bad sectors, and when I tried anoter partition it gave the same error while
writing back the same disk (12)). After that, it do a retry and no error at
all. But the next disk,13, cannot be recognised by Fcopy Pro. So now I am
stuck with 42, sorry, backed up disks and not being able to use it...
Perhaps someone knows the file format of Fcopy Pro. Perhaps someone knows the
compression method used. Perhapds someone has done advanced magic, perhaps....

HELP!

Hmm, I have just added an ISA ET4000 card to my TT via the VME port, and
I am currently considering writing some drivers for it (perhaps full VDI or maybe
just for Mint-X or Linux68K-X). A number of people have suggested that I get a copy
of NVDI ET4000, but I am not at all sure that it would work with my DIY setup. So,
can anyone give me some technical details on NVDI ET4000 and/or Atari VME ET4000 GFX
cards? Specifically, where do Crazy Dots etc map their video memory between
$fe000000 and $feffffff (TT-VME space), is it linear or paged and what version of
the ET4000 do the VME-ET4000 cards use (Unaccelerated ET4000AX or Accelerated
ET4000\W32i) ?

Hope someone can help,
Cheers,
Joe.

Yo everybody....
(Sorry if you read this allready, but something went wrong with my local nntp-server..... So this might have come through anyway....)
Does anybody know if there's still 'Wordperfect ST' available somewhere?
I would REALLY like to see this.....:)
Or else a package that converts WP PC to, say, 1wordplus, or something like that. My sister is in desparate need of such a package (preferable one that can tackle a new as possible WP formats, like 5.0 too or something) and it woult be a great (!!) opportunity for me to show here computers and the net are not only sex-gif's and dirty old men.....:)
(I hope this posting come's through, though........)

Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi !
Althoguh, i'm quite familiar with MiNT, i'm not a very experienced X-User.
I tried to add/replace the font(s) originally delivered in the X11R5-Archive
by replacing the appropriate fontfiles with other ones from a SUN.
The result was a rather strange looking Xterm. Obviously the fonts were
not ment to be used on an Atari ;-)
So, is it possible to add new fonts to Mint-X, and if so, how can it be
done ?. I know, there are tools like mkfontdir and bdftosnf but i'm not
quite sure how to use them. (I could not find the sources anyway ....)

Oh, and BTW: Anyone solved the "missing-libXext.a"-problem yet ?

From: ricquebo@irisa.fr
Message-ID: <3foeu0$bth@irisa.irisa.fr>
Source record: 172921

Does anybody have any suggestion about the best way for
printing old 'prehistorical' 1ST-WORD / WORDPLUS text file
on a Postcript laserprinter ?

- maybe a converting soft ?
- maybe several soft to chain for this final result ?

Well any suggestions or software would be nice,
(E-mail please !!!)

-yann.

p.S I tried the programm 1st2rtf available on most ftp sites:
the result is too awful to be acceptable: better insert your file
in ASCII and then reformat it, it would be faster than reformating
the RTF result totally amazing compared to the orginal file !

Dear All,

I could do with some recommendations for a hard disk for my Atari ST. I actually have a bare Quantum 52 Mb SCSI disk and wondered if it was possible to get a bare case for it, or if there were some unmissable deals out there for the ST in the HD arena that you could recommend.

Thanks

Julian

There is a European mirror, as of December last year. src.doc.ic.ac.uk
mirrors atari.archive in the packages/atari/umich directory.
: - Next I started the Installation process which worked well (it seems) but
: when I had to reboot the Hard drive loaded the Mint.prg from the auto-
: folder and hanged.
: Can someone give me a hint? What have I done wrong?
I think I see the problem. I'm assuming you're not running a machine
with a 68030 processor, you you need mintnp.prg, _not_ mint.prg. I'm not
an expert, but I'm nearly certain that mint.prg uses memory protection,
which the 68000 processor doesn't support, and hence the
crashes/hangs/etc. mintnp has no memory protection, and thus will work
on the 68000.

884. Anyone installed linux68k?

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 15:43:04 UTC
From: michaelm@cogs.susx.ac.uk
Message-ID: <3folm8$664@infa.central.susx.ac.uk>
Source record: 172928

I have been trying to get Linux68k installed on my Falcon030 WITH FPU and I can get it to boot up from the ramdisk fine, although I do get alot of scsi interrupt error reports (I only have an internal IDE). I have repartitioned my harddrive and freed up 46MB as a preliminary Linux partition (at great expense in time backing everything up!).

However, when I try to mkfs.ext2 /dev/hda3 <size in 1K blocks> as directed in the FAQ it starts ok but I get a load more of the scsi interrupt errors and then reports intermitently of bad sectors. It takes forever and eventually comes back with an errors saying that too many sectors are bad. Oh I am trying to make partition e a linux partition, hense hda3.

I know this is probably a linux newsgroup prob, but everyone there is PC linux so I thought I would try here and hope to get in contact with someone who has installed it ok for this and future references. I would therefore request anyone who knows anything of use to email me a reply to save wasting bandwidth on this.

Thankyou in advance,

Michael

But the most important point is that Linux doesn't have to force
itself onto TOS (oeerr Missus) unlike Mint, so it can afford to do
things 'right'. So it is a lot faster.

In <FASEFEUQUp@warpcon.ersys.edmonton.ab.ca> Leslie Hartmier wrote:

> Can anyone tell me if it is possible to disable the font
>abilities of NVDI 3.x without disabling NVDI? I would upgrade my

No, not really.

>2.51, but I'm not a real fan of *having* NVDI load the fonts when
>I want to conserve memory, and using SpeedoGDOS and NVDI 2.51

You can rename the NVDI.INF to e. g. NVDI.INX so the fontpaths are not found
and therefore the fonts are not loaded. However, the scalers are still active
and do use the memory.

I've talked to ï¿½B about this a couple of weeks ago and suggested a switch in
one of the CPX's to enable the scaling mechanisms if necessary. He wanted to
give it a thought, but I am not aware of any results on this, ATM. I think
I'll give him another ring ...

If you have NVDI3 you do not need Speedo at all. I assume you're running a 4.x
version together with NVDI 2.51?

Dear All
Apologies if this is not the correct place for this type of posting but
this was the only Atari based group I could find, with signs of life!
I would like to FTP some educational stuff/games for my 6 year old son
to use on his ST. Can anyone point me to a suitable machine.

895. ST Assembler - Coming Soon

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 17:45:30 UTC
From: py4sdh@bath.ac.uk
Message-ID: <Pine.SUN.3.91.950120174346.4639B-100000@ss1.bath.ac.uk>
Source record: 172935

ST Assembler is a WWW page that I'm working on at the moment. It will contain all the Atari ST/E hardware details that I can get hold off, and will contain at a later data Assembler code to demonstrate the use of the hardware.
I will be adding most of the information over the next few days, and then the source code bits over the next week. (Well depending on how fast I can type anyway).

The very small and no yet html'ed ST assembler can be found at:

http://www.bath.ac.uk/~py4sdh/index.txt

If anyone has any questions or want to donate info, articles or source code you can email me at:

py4sdh@bath.ac.uk

If your TOS version is below 1.04(I believe) then you will need to give your
disk a PC boot sector when you format it. Double Click(DC*.*) has such a
shareware formatter downloadable from just about any atari BBS or ftp site.
You should be able to read - at least once :-) any 3.5" 720Kb PC disk.

~$50Cdn
>4) SH204 hard drive (unsure of size)
~$150-200Cdn

These prices are off the top of my head, but they should be pretty close.
Yes, there is STe specific software, but it's usually not a big problem. I'd
go for the STe over the ST because: 1) TOS, 2)Sound, 3)Colour, in that order
of importance 8^)

>In summary, I'd like to receive some info about nice WordProcessors
>for the ST, commercial and shareware packages.

>Thanks,
>Ton Martens (martens_ton@tandem.com)

Well if you 'like' Windows word processors(I don't - I use them every day!)
There's DBWriter - excellent freeware from the ZeST writer, with a
dictionary, etc but non-GEM I believe, Marcel - an excellant shareware program
with a spell checker, dictionary, thesauarus?, search repalce etc and then
there's Edith Professional which I can find no words to describe it is so
good, it can even cut-search-replace-paste COLUMNS of text! I don't know of
ANY word program that can do that - but it may not be what you are looking for
as it is a text editor. Then there's a new Calligrapher(Gold I think), for
Document processing look at Redacteur or Papyrus. There are so many word
processors! This is just a brief look.
Have fun/aie FUN!

>Rod

Windows does NOT have a tool bar. 3rd party people offer them but not Windows.
os/2 Warp has a toolbar. MOST toolbars are IN the programs and are offered by
that program ie. CorelDRAW, Word Perfect. This is exactly like Atari programs
such as Calamus, any paint program.
In point of fact Toolbats are only good when learning the program, if one
wants to speed up ones use of ANY program, the keyboard shortcuts are the
only way to go! Ask anyone who knows their software well, especially in word
processing - mice slow you down! In drawing programs my left hand is on the
keyboard and my right holds my pen or mouse.

901. Legend: another try

Newsgroup: comp.sys.atari.st

Love Legend from Mindscape, but I get stuck, and plan to be stuck many more times... I think there is a cluebook, with maps, and aids for the many puzzles encountered in this game. Does somebody has it? Is there a walkthru on the net? Does someone would like to help me in my moment of terrible need ?

I have already asked this question, but didnt get an answer, so I keep trying...

902. Sinclap's brain found??

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 21:02:18 UTC
From: eddiea@bnr.ca
Message-ID: <3fp8cq$e7@crchha60.bnr.ca>
Source record: 172942

I was reading the AMW the other day and came upon this article. Are they talking about our buddy Peter Sinclair a.k.a. Sinclap?? You Decide.

This article has been reproduced in its entirety without permission of Astounding Medical Weekly newsletter (vol. 8 issue 10, pg 12):

==========

PETER'S BRAIN FOUND!!!!!

The Banzai Institute has done it again! On Jan 12th 1995, Doctor Buckaroo Banzai, with the assistance of several Institute members succeeded in finding what everyone said did not exist: Peter's brain.

Dr Banzai released the following statement:

Through the years, there have been several reports of MWOB's (Men WithOut Brains). They were all fairly easy to solve- Genetic Mental Deficiency Disorder, Heinikens Multi-Brain-Cell Shrinkage Syndrome, Saget's Brain Stem Detachment Complex. All these were discovered and identified by this Institute's previous attempts to prove/disprove that MWOB's do in fact exist.

We had heard about Peter, and the multitudinous assertations that here indeed was a MWOB did not fail to catch our attention. We contacted him early last year and invited him to the Institute to take some tests. The initial series of tests and scans looked promising, so we set up a schedule for Peter to return and take more tests. All the data was indicating that Peter was a MWOB. Then two weeks ago, New Jersey and Dr. Hakita detected a very faint neural retransmission firing in Peter's cranial area. We informed Peter of this and he was very eager to allow us to operate. At this point he had become very concerned that he might actually be a MWOB. Notoriety aside, who among us would really want to go down in history as the first Man Without a Brain? We removed the top of his cranium on January 12th. We thought we had prepared ourselves, but it was still a shock to actually view the vast empty space we had uncovered. We had intended to use our new enhanced laser scanning tunneling lepton microscope to search for the brain, but with such a large volume of space to search, it would take weeks. We could not leave the top of Peter's head off for that amount of time. In a flash of inspiration, Perfect Tommy theorized that having known Peter for the past year, we could assume that if he has a brain, it would move extremely slowly, if at all, allowing us to do away with Heisenberg's Uncertainty Principle. We quickly calculated the exact location to search for the brain, and were able to capture a picture of it with our new microscope. Peter has recovered completely and is enthused at having a new syndrome named after him - Peter's Ultra Microscopic Brain Syndrome (PUMBS).

Dr Banzai further said that after spending such an exhausting year locating Peter's brain, the Institute would be putting further research into MWOB's on

hold, turning instead to MWNP's (Men With No Penises). Although there is no comment from the Institute, it is rumored that Peter is also involved in this study.

903. Monitor agony!

Newsgroup: comp.sys.atari.st
Date: 1995-01-20 21:17:20 UTC
From: e91rj@efd.lth.se
Message-ID: <3fp990$3kc@nic.lth.se>
Source record: 172943
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Hi all!

I've come across an old monitor that has a painful(!)
resemblance to Atari's sm124 (the one with the knobs on the side), the
"box" looks exactly as the Atari equivalent but this one has no speaker
and the plastic frame around the screen is darker than the rest of the
monitor (which is/was atari-greyish).

It's from a company called Taxan (!), with ser # E4-70300086,
dated March -87. It has a chassis type MT-15 and a Goldstar tube with
a type # 31KGLA and/or (it says both on the sticker) 31KGB (russian
version ? ;) Tube serial nr. is 70302760. On the back of the monitor it
says "KAGA Electronics co LTD".

It doesn't have the 13 pin atari monitor plug, only a nine-pin
"joystick" male with only 6 or 7 pins available (it's at home now and
I forgot to write that down), something like this.

```
_________________________
| | |
_________________ |
\ . . . . . / These two pins have 1.7 and 0.7 volts
\ . . / over them when I plug the monitor in,
~~~~~~~~~~~~~~~ can't tell if its a signal or DC
```

Can I use this as a mono monitor? (it is a b/w monitor, I can
tell that from the cicuit board) What are the different pins on the
9-pin? Why do crocodiles cry? Mail or post and I will be happy.

Thanks in advance

904. Looking for (US) dealer recommendations....

Newsgroup: comp.sys.atari.st

From: catfood@prairienet.org
Message-ID: <3fpf5s$c0n@vixen.cso.uiuc.edu>
Source record: 172944

Hey gang,

Hopefully, I'm looking at grabbing a Falcon in the next coupla
months, so I was wondering if anyone had recommends on dealers they've
had good experiences with. I'm hoping to do this mail-order if at all
possible, so I can get the lowest price.

I'm grabbing this thing specifically to use with Cubase Audio 16
for Falcon, so I need to get at least an 030 with specced memory (yeah, I
know I should probably wait for the 040: if it's out by the time I buy,
then I'll get one of those), and most likely a co-pro.

I'm putting as much emphasis as possible on getting a nice low
price (hence mail-order) since I can take care of most of the basic
support stuff myself (configurations, swapping drives, etc.).

Thanx a lot!!!

In english language only the Gold version is available from HiSoft.
Since we do some optimising and switch to a better compiler,
Papyrus Gold 4.0 might run on 1 MB Ataris, but I can't promise
that yet.

Otherwise I can only agree.

A while ago I uploaded an english Demo p362demo.lzh to

Yup, there is a pin missing on STs (and TTs). I can't recall exactly right now just what, but it has to do with flow control. I've tried two printers (a Cannon dot-matrix and a HP Laserjet) which have refused to do anything with my TT and worked fine with PCs, yet other printers work fine with mine.

Daniel D Ackerman (dackerma@magnus.acs.ohio-state.edu) wrote:
: AstroPanic94! rev. c. is now on atari.archive.umich.edu, under
: Games/Space/p94_revc.zip. This file only contains the program and the
: graphics. A seperate file in the same directory, original.zip, contains all
: the sound files. And there are numerous more sound files. Several small bug
: fixes have also been applied.

: There is also now a "Select Sound Set" button that lets you select a
: different set of sounds for AstroPanic to use. Alternate sound sets can be
: located on any drive. This also allows for floppy based systems to put
: the sounds on a different disk than the game.

: For those of you who don't know. AstroPanic94! is a small shoot-em-up
: that runs in any planar video mode (i.e. 2-256 colors) any resolution and also
: supports DMA sound. It runs on video cards, TT's, Falcons, Mega's etc.

: Registration is only $5. And get's you a registered version with 2
: additional Ufo types.

: For more information, or comments or bug reports.
: Write me at baldrick@terminator.rs.itd.umich.edu

: Thanks,

: Dan Ackerman
: baldrick@terminator.rs.itd.umich.edu

Does it work on Ste ?
On my Ste this AstroPanic plays the intro sound (siren), shows
the image , and then when I push the left mouse button bombs (two
bombs),
and returns to desktop ..

I've also try it on MegaSte with 4MB RAm without cache , 8MHz;
with cache & 16MHz, and on 16MHz without cache (all possible
combinations).. but still doesn't work (two bombs afterpicture).

Also, I've try it on clean system with and withot hard disk ..
(starting it from hard d., and the other time from floppy).

<snip, snip>

I don't know the method of how it's done but I do know that 2 way data transfer is possible via the ST's centronics parallel port (and its quite fast as well)

How do I know you may ask ?? I have *ATARI* produced software that was produced for the STbook data trans to the ST,TT,Falcon (the STbook does not have a floppy only a HD).

AFAIK the magic is carried out within the CABLE.....

I'm sure that the *SLAVE* side of the software could produced for the other type of P.C.'s (you know those "clone" types and Mac's) it's just that nobody has sat down and done it....

BTW the above software is in two parts MASTER & SLAVE. It's simular to GhostLink in operation BUT without the excellent Ghostlink desktop operation

eMail me if you require more info

Regards Fezzy

>coumns (Or counting from 0 as Fansi does, to 78 columns). This also makes
>sense in that if you have your screen full to the 80th column of anything,

Well Eric you were right. I tried that and the program worked
great. You did an excellent job on that program. Now i do have
another question! I would like to register it, and in the registration
form that comes with the program, you say to leave you email it
would speed the process along, so im doing just that right now.
The mailing address is still the same and the cost is still $15.00
correct?
Can i ask you anothe question not about fansi do you know of a
good drawing program for vt52 screens? If not do you think fansi might
ever have one in any of its newer updates..Well thanks again eric.

I agree that the latest issue of ST Format is much the same, thats because I would expect the new Editor to take a least a month or two before she starts to make changes. She at least has a reasonbale pedigree ie Mac Format amongst others. Maybe the magazine will get better, I certainly hope so, both as reader, enthusiast, advertiser and someone who does make his living from the Atari market.

You can get Lynx for the ST but it needs MiNTnet, which needs MiNT and
preferably MiNTOS. And preferably its own minix partition.
It can be done and works pretty well but you need some HD space and a little
Unix knowledge or some help. If you've got that - I recommend it.

923. Atari upgrading

Newsgroup: comp.sys.atari.st
Date: 1995-01-21 12:59:20 UTC
From: dwalker@island.net
Message-ID: <3fr0f8$m9v@cliff.island.net>
Source record: 172873

Hello folks

I've just come across this group, much to my delight, and have a few
Q. Ive had a old 520 st, w\ a 1224 monitor for a year - but I'm starting
to realize some of it's limitations. I bought myself a 486 PC and gave the
Atari to my daughter for now as I actually like the old machine - it's
a real workhorse, and seems really reliable.

However I'd like to upgrade it, to make it a bit more usable for her,
and eventually I'd like to use it to drive synths/drums etc

I understand the basic upgrade reqs - mem, SCSI H.Drive DS drive - but
it appears expensive (600 cdn.), any info on cheaper or alternative configs
would be appreciated.

As well, any directions to obtaining a suitable VT 52 or better Terminal
prog would be appreciated.(how fast of a modem can a 520 handle?)

In the short term I'm trying to figure out how to format DS disk progs
into SS format, as the machine has only a SS drive - i've followed
(the somewhat scetchy) dirs in the manual to no avail ??? pls help, as
Iv'e access to loads of DS progs

Thanks in Advance
dwalker@island.net

925. How to read cursor keys?

Newsgroup: comp.sys.atari.st
Date: 1995-01-21 15:05:37 UTC
From: artoj@mits.mdata.fi
Message-ID: <3fr7s1$ebq@prime.mdata.fi>
Source record: 172875

> I am writing some game and was wondering how to read (in C) the arrow or
> cursor keys. Now I use the numeric key pad but I want to use that for
> something else. I tried to read and echo these arrows but all turned out
> to be 0. Is there some other function I should use? Something like reading

You have to read scan codes for arrow keys as they don't have ascii
codes. Every key in your keyboard has a scan code, and ESC is the
first. To read scan codes, you can, for example, use
Crawcin() (GEMDOS function) which returns a long word. Bits
31-24 are Shift key status, bits 23-15 scan code and bits 7-0
ascii code. Bits 15-8 seem to be allways 0.

AIUI NeXT pulled out of the hardware business because they weren't making
enough money, they now concentrate on their o/s NeXTSTEP which is now
available for Intel processors and soon to be others too.

I'm not sure when or how long they were in the h/w business, '90, '91 but
yes they were/are really nice machines, I guess they were just too expensive
otherwise they would've sold better.

The 040 25Mhz on my desk at work multitasks beautifully.

You can use the adaptors e. g. from a Megafile 30/60. AFAIK, there are no
adaptors available like the "Link" ones for SCSI drives.

There was s. th. about an OMTI controller sometime back, but I dunno about
that one.

931. Mega 2 ST and SW/HW Sale (long post)

Newsgroup: comp.sys.atari.st
Date: 1995-01-21 15:27:56 UTC
From: tgrel@aol.com
Message-ID: <3fr95s$893@newsbf02.news.aol.com>
Source record: 172878

*** Long post warning *** Mega St and 'accessories' for sale!

Since I've had an avalanche of interest, I've decided to sell the whole deal to the highest bidder. (Escpecially since I don't know the current market, and you supposedly will) If I don't like the price (< $500), then

I'll just keep the machine and my (eventual) kids will have enough games to keep them happy a long time. I invested thousands here, so someone is going to get ALOT for their money.

All items are at least 4-5 years old. I don't have the latest 'anything'. I'll leave that up to whoever gets the system. All software comes with boxes and doc's unless otherwise listed. I got alot of this stuff when I bought the system, so I've never even run it myself.

Please email tgrel@aol.com with any questions, offers. I'm NOT breaking up all this stuff seperately, so don't ask. I want one buyer, and its gone. Shipping costs will be the buyers responsibility. I will only sell it C.O.D. and as a warning the shipping will be over $50 (I'm positive of that).

Here we go....

Hardware

MEGA ST 2
Mono Monitor
Color Monitor
Monitor Master
85 Meg ICD hard drive (needs new power supply)
360k 5-1/4" external floppy drive
Okimate 20 Color Printer (three black and one color cartridge)

932. SUPER BOMBERMAN

Newsgroup: comp.sys.atari.st
Date: 1995-01-21 16:19:40 UTC
From: bourlon@gla.ecoledoc.ibp.fr
Message-ID: <3frc6s$ei4@vishnu.jussieu.fr>
Source record: 172879

Hello,

In April 1994, I wrote in this newsgroup to ask if people would like to have a Super Bomberman clone on the Falcon. I thought I had understood that Falcon users were complaining about the lack of Falcon-specific programs, and especially games. I then received more than ten positive answers : not much, really, but I found it encouraging, since
it was just a question.
Three weeks ago, I uploaded the first playable version on ftp.cnam.fr . Do you think I received many leetters, from thousands of poooor Falcon users that finally get a good and funny game (although in a previous version) ?? Nope. I have only received two or three letters, nearly each of which telling me it didn't work. An improved and correct version was spread a week later. Not even ONE answer... I even wondered if I would finish it. I hope I'll receive more news from you, all of you. You can get the last version (dated yesterday, Friday, the 21st of January 1995), on ftp.cnam.fr, or ftp.uni-kl.de, which features :
- from 2 to 6 players
- 3 different levels
- many bonuses : bombs, flammes, kick, punch, speed
- many maluses : slowness, turbo, no bomb,...
- "five legs win match"

Of course, as it's not the final version, it lacks from :
- real music
- nice sounds
- more levels
- more options?
- decent menu
- more ?

It's NOT a freeware game. It's not a shareware either, I fear from copyright problems by Hudson Soft. BUT, if Falcon users want good and many games...they know what they've to do....

MB.

: Obviously an HD drive will write perfectly as will some newer DD drives (like mine).

: In fact many of my disks are HD's are formatted to 84x11 (=935k) but don't do it yourself
: unless you fully appreciate the risk.

What are you guys on??? All HD disk are is DD disks that are better
quality thus allowing more data to be stuffed in the same space 1.44
rather than 720. You can make DD into HD by making a hole the other side
but they won't be very reliable. But using a HD as a DD will work fine
although you will have to tape up the HD hole if using it on a HD drive
when it is formatted to 720K because the drive will think it is 1.44
formatted but apart from that a HD will behave and be as reliable as a
DD disk. What you guys are on about is totally wiered??????

Any PC with Linux on it? And that one is FREE. Tons of software for it ,
either.

And on my MegaSTE I use 1.8 meg floppies, so what? 82 tracks with 22
sectors/track. What's the big deal?

And if the grafics on the PC are that slow, I'd change it to a decent board
anyway. Activly accelerated, PCI, 2megs of DRAM, support for all major OS's
for under 500,-- DM. That'll blow away any Acorn.

>I think you can stack up to 7 processers...

Does the OS support that? It'll cost a fortune, though.

It was none other than Roger Sheppard. who wrote on 15 Jan 95 that ...:

RS> WinX22 that I have just dnloaded does not have a program to copy
RS> ROMs to a file...

You need to get it seperately ,either GEMRAM15 or ROMSPEED. (The later using
huge amounts of memory and only worthwhile if the former gives problems).
WinX23g and GEMRAM16 is the latest versions.

RS> Is there a different WinX with Gemview....???

Beats me too ..there is no WinX or Rom/RAm patch included with Gemview ?

It was none other than Christian Mittendorf who wrote on 14 Jan 95 that ...:

CM> MPEG and FLI could I now watch with my F030. But there are still AVI
CM> and Quicktime which could be found very often on all of these
CM> Multimedia-Magazin CD's (Most of them are really rubbish - but I also
CM> found some nice animations
CM> which I watched on my brothers PC.)
CM> Does anybody have information about these formats? Is anybody working
CM> on a player for these animations?

There are some Mpeg players the best one using some DSP code is called Mpegplay
IIRC. FLI files we are much better served with. There are some very good French
FLI players that have been around for ages but the Viewer/player distributed
with APEX is a recent addition and not only plays FLI (256 colour) but FLH
(hi-colour) files and can be launched from any res
and is very fast. APEX itself is able to edit/create and maniplute all FLI
formats. The viewer AFAIK is available seperately and maybe for download
(anyone confirm that ..Daron?)And a demo of Apex has just been released.

I just downloaded a bunch of stuff for KA9Q (NOS) from a.a. I got NOSFILES and NOSDOC, too... Trouble is, I don't know how to set it up, or what I need at the Unix end (i.e. not my ST end). Anybody have some documentation for this, or know of a better way to get SLIP and/or PPP?

[I first tried the 900kB "install" version in th Install directory under Ka9q/Nos -- it wouldn't extract itself...]

> Also, I've try it on clean system with and withot hard disk ..
>(starting it from hard d., and the other time from floppy).

Are you using rev.c? The first release and rev.a behaved in this way on anything other than a Falcon. But rev b, functioned on any TOS compatible machine. Please check the original archive you got and find out if it's rev.c. If it's rev. c. You would have had a directory called PANIC.REL and inside that another folder called IMG, and then PANIC.PRG, PANIC.DFT, PANIC.TXT and UPGRADE.TXT. If this is what you got then please let me know what site you got it from so I can test there archive and see if that's where the problem lies.

Thanks for your message, hopefully we can get this figured out quickly. If anyone else is having problems with rev. c. please let me know.

Thanks,

Dan Ackerman

: another question! I would like to register it, and in the registration
: form that comes with the program, you say to leave you email it
: would speed the process along, so im doing just that right now.
: The mailing address is still the same and the cost is still $15.00
: correct?

Correct. I am pleased that you enjoy the program ... E-Mail does speed
things up faster -- but the E-Mail was for after I recieved your
cheque/money order (the latter is preferable), so that if you leave me an
E-Mail address, I can just E-Mail you your registration key, rather than
having to use snail mail; it's much faster. :-)

: Can i ask you anothe question not about fansi do you know of a
: good drawing program for vt52 screens? If not do you think fansi might
: ever have one in any of its newer updates..Well thanks again eric.
: Arthur

I have considered and in fact intended to add in VT52 support, though mostly
in the form of VT52-E (16-colour variant). I may put in VT52 support as
well, for the 4 colour variant, in a future update. Unfortunately I don't
know any really _good_ VT52 editors... most of the ones I saw were pretty
basic and had very few features.

>
>i would appreachite too some advices ...

The Atari printer port has NO automatic strobe on writing to the data port
(the C-64 PIA can be programmed to generate a strobe on write), you have to
put the data to port B of the PSG and then toggle the strobe line yourself
by bitsetting and clearing...
With some careful asm coding you can reach about 100kb per second writing
data on a standard ST. (I used this to fill up a 512kb ROM emulator)

In principle you can connect two ST's with the datalines tied 'one-on-one'
together, but chances are you blow out one of the ports (or both). For
safety I placed some 1k resistores in series with each dataline. You will
have to cross connect the strobe and busy lines.

When using the port for input (with TOS) through the Bconin call (BIOS 2)
the port is automatically switched to input.
The performance through TOS Bios routines is low, say about 1kb per
second...

953. Booting problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-22 14:49:54 UTC
From: mark@forsyth.demon.co.uk
Message-ID: <950122Z144954.082mark@forsyth.demon.co.uk>
Source record: 172803

Help. I am having a few problems with my STE 4Meg, Monochrome system.
Occasionaly (although getting more frequent) when I switch my system on
I get 4 bombs (I think this is an Illegal instruction but I'm not sure)
If I then press the reset button, the screen goes blank, there is no HD or
FD access and nothing more happens. If I then switch off and leave the
system for a while,and then try again it sometimes comes back. Since this is
an intermittent fault I dont want to send my machine off as with my luck
it will work OK all the time it is at the shop. If you have any ideas as to
what my problem may be please get in toutch.

954. GCC installation problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-22 15:03:46 UTC
From: ied2@aber.ac.uk
Message-ID: <3fts4i$2qi@osfa.aber.ac.uk>
Source record: 172804
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

I've just installed GCC on my Atart STFM. When I attempt to compile any
C program (say first.c) I get the following error reports:

```
In file included from first.c:2:
e:\\gnu\\include\\stdio.h:85:'fp' undeclared, outside of functions
e:\\gnu\\include\\stdio.h:86: parse error before ';'
e:\\gnu\\include\\stdio.h:87: parse error before '{'
```

The file first.c is just a simple 'Hello World' program. eg.

```
#include <stdio.h>
main{
printf("blah");
}
```

I looked at the offending lines in stdio.h:

```
line no.
84 if defined(__GNUC__) && !defined(__NO_INLINE__)
85 static inline int __getc__(fp)
86 FILE *fp;
87 { int c;
```

As far as I can see, everything is set up OK. My environment vars are
fine. My GNU stuff is all in e:\gnu, includes in e:\gnu\include, libraries
in e:\gnu\lib and binaries in e:\gnu\bin.

What is going wrong? What's wrong with my STDIO.H file? All the library and
header files are the ones which came with the distribution of GCC I'm using.

I've tried versions 2.5.8 and 2.3.3b both with the same result.

In case it matters, my setup is :

2.5 meg Atari STFM with 40 meg Vortex HD.
TOS 1.02 with NVDI 2.5 installed.
I'm calling GCC from the PCommand CLI.

I'd appreciate any help you could give me. Either reply here on the group
or to me personally.

Thankyou very much.

Pretty sure System Solutions sell the Atari Compendium.
I have a book i bought from HiSoft called `Modern Atari System Software`
which lists all the Falcon specific OS calls, Trouble is it doesn't list
all the older OS calls so you'd need another book as well

Message-ID: <3fu6i3$74m@news.bu.edu>
Source record: 172809

Hi!

I've got a 1040STe tos 1.6 Adspeed St/e 16mhz, Mint 1.12 MintNet .6 Mintos (whatever the latest version is) Minixfs (ditto) and I'm just trying to get X up and running. I have so far gotten an X display (desktop) with 1 xterm window on it, with tcsh in it. While it seems to be OK, many of the keys are mapped wrong (ie. the 'y' key produces a 'z' and vice versa). In addition, the xterm window is not resizable, or movable, and neither is the xclock when I run the program. Also, I am no longer asked a login and password, and I end up on the root directory of k, my minix mint partition.

When I do finally get these things worked out, how will X work with Slip? Will I be able to hold 2 xterm windows with different sessions in them?

Puzzled, dazed, and confused,
Steve

961. Time to put my 1040STf out to pasture?

Newsgroup: comp.sys.atari.st
Date: 1995-01-22 19:07:01 UTC
From: pking@random.ucs.mun.ca
Message-ID: <3fuacl$clg@coranto.ucs.mun.ca>
Source record: 172812

Hello folks,

I was an avid Atari devotee for many years, having had many
atari's since I first tickled a computer's keys. However, I have been
out of the atari world for many years since I found NO support from any
local supplier. I have recently gotten into the Internet and have been
using my old machine to connect. I have:
1) One of the first 1040stf machines with no modifications.
2) A SC1224 colour monitor.

That's it. The machine must be getting close to ten years.

I would like to use my computer for slip/PPP clients. My
question is: Is it time to retire the old girl?

I realize that getting slip/PPP/Ka9q may be asking a lot of my
old machine without more memory and a hard disk drive. Is there any hope
or should I just seriously think about a new computer? I have been out
of the Atari loop for so long that I don't know what is out there.

If my atari can be brought back to life, I would appreciate any
suggestions.

There must be others out there in the same boat.

Thank-you in advance for any help or suggestions!!

Peter

Get NOS042.TOS from ftp.demon.co.uk. This archive contains nothing but
the necessary stuff and will ertainly extract itself allright. Also,
there are all steps for installation in there.
You need a UNIX-machine with any setup capable of TCP/IP. (== _any_
Unix-machine)
Better idea though, if you have more time: Get mint and mintnet.

Try atari archive (or better still the mirror on imperial college).

ftp.doc.ic.ac.uk:
/computing/systems/atari/umich
Mint/mint112b.zoo
Mint/Network/net-060.tgz
Mint/Filesystems/mfs609b.zoo
Network/Www/lynx-231-beta.tgz
Mint/Utilities/mintos14b.zoo

These aren't the exact filenames - but they are close enough to give you an
idea. I recommend if you get this working you also get Mint/Network/ncftp.tgz
because it is much faster and better than the NOS version - but once again
needs setting up.

STs are still used a lot for MIDI -- they're really cheap and can handle a lot of MIDI traffic with ease, plus MIDI software is still supported on the ST. As far as using them for anything else, this becomes a personal thing (i.e. if the computer does what you need it to do and you're happy then it's cool). Many professional musicians use Ataris, including one of _my_ favorite bands, Skinny Puppy ...

This doesn't mean Ataris are any better than Macs, PCs or Amigas for MIDI, though (though certainly not any worse). I just bought Emagic's Logic 2.0 for my Mega ST4, and have been _very_ happy with it. It's a lot better than my old sequencers (Twelve, RealTime) and I think it's easier to use than Omega II (which I have, but never liked, power notwithstanding). I plan to trigger samples on my PowerMac (running OSC's Deck II) via Logic, and Logic supports the Mackie 1604 with Otto (MIDI automation for the mixer). Plus, Emagic also makes SoundDiver for the Atari, which I plan to get soon (I currently use X-oR but don't want to upgrade, as i've heard bad things about MOTU support).

Sorry about the long-winded reply -- music is life to me ...

John

967. "The Atari Compendium"

Looking for this book. Does anybody have it, know where it's available, how much it costs? Exactly WHAT kind of information is in here? I am looking for programming information, tips, etc.

Also:
"Mapping the 68000." Where is this book available/does anybody have it?

"Michtron's GFA BASIC" book (unsure of title) Is Michtron still around? Someone who has this book told me the (c) date is 1988 on his copy. Is this available/does anybody have it?

THanks!!!!

James

KL> heard of "Gemulator", but the going price for it appears to be over
KL> $200. I was wondering if there was anything a bit closer to the
KL> free end? :-)

There's the Janus board from vhf Computer... You won't like it's price very much, though (roughly DM800.--). A 16bit AT Card with a 16MHz 68k, an MFP, some PALs and TTLs, and sockets for TOS 2.06 and two 8bit SIMM modules on it.

Mail me if you are interested in how well it works; I will install one this week.

Easy: use a VT100 terminal emulator and use lynx on your UNIX host.

Maybe you can use lynx under minix?

Or run under Linux and use Mosaic?

You can also look at local files under TOS with lynx for Atari.
Just local files. Worked for me. I used a command line program.

Henk

BTW: I would like a SlipKnot-like program under GEM!!

Before anyone else mails me - yeah, I'm aware that in my last posting I used a faulty C program as an example. I was rushed for time and just typed it wrong when I posted. Sorry. The fault on my system doesn't lie with my programs - all have compiled correctly on Lattice C and GCC under Unix. It's been suggested that the STDIO.H file is simply badly written on this GCC implementation. Should I just replace it with one from an earlier implementation? I'll try it and see.
Thanks to Michal Jaegermann and A.I. Nicholls.

978. MGIF 4.4beta, feed-back wanted

Newsgroup: comp.sys.atari.st
Date: 1995-01-23 00:14:15 UTC
From: d8klojo@dtek.chalmers.se
Message-ID: <3fuscn$hg0@nyheter.chalmers.se>
Source record: 172828

It's now been almost two weeks since I posted here about the public
beta release of MGIF 4.4. Since then more than 60 people have fetched
some version of the archive from rand.thn.htu.se.

I'm very glad to see that so many are interested in my program, but
I'd _really_ like to get some feed-back on it.
Don't think that someone else has mentioned what you're thinking about.
(The probability of that is quite low right now...)

Has MGIF crashed on you?
Have you discovered any bugs?
Any opinions on the interface?
Did you understand the documentation?
Graphics card etc you want output support for?
Do you badly miss any file formats for read or write?
What should be the first thing to use the DSP on the Falcon?
Interesting image processing functions you'd like to see implemented?

Please, email with any questions etc you might have.
For bug and crash reports I'd of course like as much information as
possible, but whatever you've got is better than nothing.

If you're running MGIF on something a bit out of the ordinary, such as
an accelerated ST/Falcon, a TT etc, I'd be very interested in some speed
figures (on GIF loading, drawing, filtering etc).

The latest working MGIF can always be found on rand.thn.htu.se.
There have been four updates since the original archive appeared.

Short summary of what's happened since January 8:
(A somewhat longer list can be found on rand.)

- Self-loading .FL files.
- IMG loading.
- Bad convolution filter bug (under GUI) fixed.
A file with some filtering ideas included.
- Load .FL files from GUI.
- 4.2 vs 4.4 .FL file compatibility fixed.
- Button size problems fixed.
- Scrolling during zoom and cut now works (almost) fine.

979. QMI DeskCart! cartridge help!!

Newsgroup: comp.sys.atari.st
Date: 1995-01-23 00:58:12 UTC
From: joneil@infi.net
Message-ID: <3fuuv4$37k@lucy.infi.net>
Source record: 172829

I have a cartridge for the ST called "DeskCart!" by QMI (Quantum Microsystems Inc.). The owners manual describes this cartridge as a set of GEM Desk Accessories on ROM including a battery operated clock, calendar, notebook, cardfile, calculator, control panel, disk utilities, ramdisk control and more. Sounds great but I don't have the disk software that came with cartridge! I've tried contacting the company but they seem to be out of business. If anybody has this software or knows where I might find it please email me! The files required for using the cart are BOOTCART.ACC and DESKCART.RCS .

Also if I can't find this disk, is there another way to access the cartridge?

Thanks!!
John O'Neil

: some PC FAX software that intercepted the print request and routed it to the
: FAX, but it required you to pretend your printer was some flavor of Epson, no
: matter what it really was. Of course, when you receive stuff, it's important
: to be able to print it, and at that point, you can no longer pretend to have
: a different kind of printer. His printer is a Star B-10. (BTW, he never got
: a screen dump to work with that printer. Is there software for that now?)

: I recommended Uniterm for the data section of a modem. Is there something
: better now? As I remember, Uniterm was pretty good.

That was a long time ago, I suppose.....:)
I really hate Uniterm, it keeps locking up. I'm currently using FZDSterm,
which is really superb, except for the fact you can't register it any more.
However, a friend of mine is now using STorm, (no, not Stormtracker) and
he claims it's perfect. Kinda looks like CoNnect, but with better
features, it's completely in english (with some german docs i think) AND
it's capable of sending faxes. Or so he says.
I haven't seen it anyware on the net, though, but I'm supposed to get a
copy, and it's shareware, so I'll dump it on a few FTP-sites, IF the copyright
lets me. But I think so.

: He wants to do the whole thing for under $150, because he's found a FAX
: machine for that price. But he'd rather not print stuff just so he can
: shove it into the FAX machine, and then throw away the paper.
Under $150 should be no problem, a have an OK v32bis/v42bis (That is,
14k4, with MNP2-5 and LAP-M errorcorrection, and MNP5 and v42bis
compression, claimed to make the transfer around 25k (I've allmost seen
him doin' it, with compressed stuff!)).
And it cost Dfl 250, that's arround $150, a bit less I think....
Look arround!
Anyway, good luck.

It is! Unfortunately it`s also just a tad bit outdated. :-)

> However I'd like to upgrade it, to make it a bit more usable for her,
> and eventually I'd like to use it to drive synths/drums etc

To run decent MIDI-software you will need at least one meg of memory
and a DS drive. I don`t think a HD is a must for MIDI, but it will
of course make everything much easier.

> I understand the basic upgrade reqs - mem, SCSI H.Drive DS drive - but
> it appears expensive (600 cdn.), any info on cheaper or alternative configs
> would be appreciated.

Upgrading an Atari ST has never been cheap. My suggestion is that you
dump the machine and buy a cheap second-hand STE. That will give you
a DS drive and possibility to upgrade to 4MB of RAM cheap and easy
(just plug in a couple of SIMM-modules).

To add a SCSI-drive is easy, but will probably set you back more than
you first thought. AFAIK there`s no easy way of fitting one inside
the case, so you will need an external case with a power-supply. In
Sweden this is rather expensive. You will also need a SCSI host-
adapter and some software to operate the HD. You could probably get
a case and an adapter with software for around 150USD.

Another way to go could be to add an IDE-drive. There are cards you
plug in on the motherboard that gives you TOS 2.06 and an IDE-interface.
If you`re lucky you could find a cheap and small 2.5" drive that would
fit inside the original case. If you`re REALLY lucky the original PSU
(which probably is total crap) will manage to power the drive too.

> As well, any directions to obtaining a suitable VT 52 or better Terminal
> prog would be appreciated.(how fast of a modem can a 520 handle?)

There are a couple of ShareWare term-progs available on the net. Personally
I`m using Connect which is _very_ good, especially if you have some
extra speed and a good resolution. For a plain 520 you would probably
want something that doesn`t make use of the slow VDI. Have a look at
Freeze Dried Terminal. It`s supposed to be really good!

AtariWorks isn't a very good example of a good user-interface design.

>The lack of toolbars in programs is partly to do with Atari not making it easy,
>but also that the developers for not having a go (IMO)...

It's actually very, very easy if you draw your toolbar in another window
(like PageStream, and probably most programs with a batch of tools
on-screen), but harder if you put it in a window with something else.
But not really much harder (if you're clever, or have good tools, like
GEM++).

The older version of Mupfel that I use (from the Gemini 1.21 dist.) has
a setting to use UNIX-style directory separators. I'd turn it on, but I
often use zoo, which needs '/' as a command.

No. There is a option which allows '\'. See the 'set' options (is it set -\ ?).

This is wrong, when running on a plain 68000 MiNT automatically turns
off the memory protection feature. It's just a matter of setting a
variable inside MiNT, i.e., the binaries are identical, unless you use
a version compiled explicitly for the 68030, but then renaming to
mintnp.prg won't help either.

994. TT as X-Terminal?

Newsgroup: comp.sys.atari.st
Date: 1995-01-23 10:42:14 UTC
From: ralf@afsysent.de
Message-ID: <173@kirk.central.afsysent.de>
Source record: 172844

I plan to use my Atari-TT as a X-terminal via SLIP. My first idea was to setup
linux bot I've heard that network stuff currently is not supported for the
atari version. In a news-article I've read that X is available for mint.
My problem is that I don't know very much about the current Mint version(s).
Question:
1. Is it possible to set up Mint and its X implementation so that
my TT can be used as an X-terminal?

2. Are there other solutions for my problem?

It would be nice if somebody can give my information. If this is a FAQ I'm
sorry for that.

Best regards
Ralf

995. Pure C vs Lattice C

Newsgroup: comp.sys.atari.st
Date: 1995-01-23 10:58:15 UTC
From: lundquist@panam.edu
Message-ID: <3g0247$qm1@spectre.techrscs.panam.edu>
Source record: 172846

Hello Netters,

I would like to buy a good C development system for the Atari ST. I have
been using Sozobon 2.0 but I really want source level debugging.

I was wondering if anyone could tell me the pros and cons of Pure C and
Lattice C. From the descriptions, they seem roughly equivalent.

Thanks,

|>I would REALLY like to see this.....:)

Wordperfect Corp dropped support of the ST version of Wordperfect a couple of years ago. I remember writing a letter to them at the time and in response I received a poorly xeroxed form letter saying basically "Tough!". They did offer me an upgrade to the PC version (Oh Joy!) for a "limited time". At the time, I believe that they also abandoned their Amiga and Apple II users along with the Atari.

I think the last release was version 4.1. I haven't seen anyone offering old copies for sale in a long while.

Yes, that's right! On my VGA-Screen it doesn't run! You have to make a better description (monitor, resolution etc.) or a change in the screen-switching. Most Falcon-Owners have a VGA-Monitor, so don't try to set 50 Hz! I hope you can change this.

Bye, Martin

Mm, I once heard that an RS-232 cable can be up to about 30 meters (98 feet).
Since an null modem cable is an RS-232, I think you can use this length.

This would be of interest for me, too!
I'm using a 1040ST with an 68030.
But I will have to use the PPP protocol. Is that possible, too?

From: redhead@sys6626.bison.mb.ca
Message-ID: <ai1DZc2w165w@sys6626.bison.mb.ca>
Source record: 172754

Hello to all in the UK! I am interested in knowing how some Atari UK Computer shops are doing selling the 1 Meg Falcon at 255 pounds???

How is it you are able to purchase them at such low prices, when here in Canada, they still cost $1150.00?

Are they selling well? I hope so, at that price. everyone should own one now. After all when the UK users where surveyed over a year ago, 80 percent of you reponded by saying you would buy one!

Any response here would be welcome, as I am curioous to hear how things are going there.

.....and please, no demise of Atari comments as they still are producing Falcons in their current configuration as market demands.

Thanks..

Eva Crouse

Try a local Commodore 64/128 user group.. or a place where Commodore
accessories are sold. The joysticks are the same. I use my old Wico
Bathandle on my Mega STe that I had when I used a Commodore 128. If
you can find one of these, you'll be impressed.. they're simple but
extremely sturdy.

: I just downloaded a bunch of stuff for KA9Q (NOS) from a.a. I got
: NOSFILES and NOSDOC, too... Trouble is, I don't know how to set it up,
: or what I need at the Unix end (i.e. not my ST end). Anybody have some
: documentation for this, or know of a better way to get SLIP and/or PPP?
There's an Atari Slip-FAQ, that might help....
it's on http://www.dl.ac.uk/MISC/ATARI/SLIP_FAQ
Loads of info...:)
Setting up NOS isn't to hard.....
customise the dial.txt, the startup.nos for youre system, and (if nos.ttp
isn't in .\spool\) use the -d option to set the startup-path.
now youre modem should begin dialing.....
There is some trouble with the cwait command, but it should work as it is...
On the unix end, you would need ppp/slip software.....
try typing 'ppp' or 'slip' on the prompt to see if youre provider has it.
Mail the helpdesk or something to find out how to login with ppp or slip
(either login: slip password: youre own, or login: [P/S/D]name password:
youre own. It could be something else though....)
put that sequence in youre dial.txt.
now it should work.
The commands are more or less like unix.
try and find out!

: [I first tried the 900kB "install"
: version in th
: Install directory : under Ka9q/Nos -- it wouldn't extract itself...]
I don't know about that..... sorry.

It's available from Toad Computers for US$44.95.

> "Michtron's GFA BASIC" book (unsure of title) Is Michtron still around?

Michtron is no longer around and that book is long out of print. Your only chance would be to find a used one or a dealer which may still have a copy. Toad lists two GFA books, "GFA BASIC Dev. Book" and "Concepts in GFA" in their latest catalog ($37 and $14 each, respectively).

It would be nice if you would also mention that your disks contain ONLY
public domain or shareware software and no copies of commercial software.

Pirates (and other criminals) are not appreciated here and I'm sure you
don't want to be inadvertently associated with such scum.

It's way before CDs, but....

Kraftwerk toured with a few Atari 800s in the early '80s. It was shortly after the release of the "Computer World" album. I think that was the name of it. They were the first band to use a computer that I know of.

Well, there is nothing strange about using the port for I/O, the trick was doing it fast and finding out the portfolio transfer protocol (had some help from a friend in Germany whos e-mail adress I have lost...)

If anyone would like the assembler source for using the port, write a private message to me and I'll send it (no point posting it public)

I'm pretty sure that Calamus SL is available for the Mac in Germany, and I know that you can get Calamus SL for Windows NT.

You'll start to see some changes from issue 68 onwards. For a start, ST Answers
is getting bigger - at least 8 pages per issue. And no, this isn't because
of 'incorporating'
ST Review. The extended ST Answers section was planned as long ago as last
October.

It just takes a few months for ideas to reach the on-sale issue.

On a similar note, you maybe interested to know that I have just networked
2 of the ST's in my house using 20 metres of shielded cable through the
midi ports! there is no problem using MX2NET, Midimaze, or Rayoid so
probably there would be no problem with any software.

Just FYinterest!

Being a Logic Audio user in Canada, I'm curious as to why Emagic would
ignore a good portion of their market as you say they are. I, too am
under the impression that they have pulled out of support for the North
American market, but why? Have they made Logic so CPU intensive for
the 68030 processor that it simply cannot support Audio tracks the way that
the Mac version does?

1022. Outburst

Newsgroup: comp.sys.atari.st
Date: 1995-01-23 19:09:36 UTC
From: az822@FreeNet.Carleton.CA
Message-ID: <D2vH80.MnG@freenet.carleton.ca>
Source record: 172771

I recently purchased Outburst to speed up my printing, and it does work
very well except when I want to print from Logic (a music notation program).
To print 1 page of notation takes over 7 minutes (with Outburst disabled)
on my Brother HL-6 laser printer (2.5 meg ram). With Outburst enabled it
takes the same amount of time, and it doesn't matter if autospool is on or
off. I have set up a 1 meg buffer for the spooler but it doesn't spool as
it should. I'm under the impression that I should be able to use my
computer while the printer is working on printing the page but this is not so.
If anyone has any ideas or suggestions I'd appreciate it!
I have a Falcon, TOS 4.04, AHDI 6.061, 16 megs of ram, a Dynatek 1.08 Gig
harddrive, Steinberg FDI (digital interface), Practical Peripherals 2400
baud modem, and as mentioned Logic Audio Falcon 2.0.

Thanks in advance

Angus Armstrong

: But the most important point is that Linux doesn't have to force
: itself onto TOS (oeerr Missus) unlike Mint, so it can afford to do
: things 'right'. So it is a lot faster.

I'm thinking of installing Linux as I've just royally screwed my MiNT setup and will probably have to reinstall a large part of that anyway. A few questions:

i) Just how well adapted is the latest version to the Falcon? Will I have to apply tonnes of patches to get it to run properly?

ii) How stable is it? MiNT is *very* stable on my setup (4Mb RAM, IDE hard drive) - for me to use it Linux will have to at least be stable enough so that I can do development work inside it comfortably. Does Linux get at all unstable when it starts doing a lot of paging to disk?

iii) Has anyone actually benchmarked it against a properly set up MiNT system yet? If so, how _much_ faster is it?

ATB,

Martin

So does it on mine. But have you checked out, which drivers are in
your /mint or /multitos directory?? Some drivers may collide, e.g. the
plip and lpdev drivers don't work simultaneously, of course. I'e had a
problem similar to yours which was because of a faulty combination of
drivers, but didn't look like it at first, because none of the
programs were able to show any messages before the crash.

Well I haved a 10-15 metre one. AFAIK you can get away with quite a lot
more. There are signal amplifiers around which will boast the signal,
though you won't ba able to run very high speeds through them.

:-)

From: lnonvei@public.srce.hr
Message-ID: <3g1m3m$ogl@nippur.irb.hr>
Source record: 172789

Hi!

I need help with my GVC 14400/FAX Modem. And the problem is .... I have Mega STE (TOS 2.05) and HSMODEM 04. I checked them many times, and nothing. When I connect to local host at 14400/V42bis, time after time error occures, and communication freezes (on line, but no send/receve). The local host seems OK, 'cause my PC friend is using it without any problems (14400b).

I ask anyone, who has the same modem, to send me, please, his modem setup (PROFILES).

Thanks in advance.

Atari ST for sale!

Included is 520ST upgraded to 1040ST (1 meg and DSDD), Atari color monitor, Star NP-10 Printer, All original docs.

Some software that is included (theres more, but I'm not going to list all unless somebody asks):

Dungeon Master, Flight Simulator, Degas Elite, Wordwriter St, Pagestream, Bowling, Golf, Midisoft Studio, MT-32 Editor,Lotus 1-2-3 Clone, Gauntlet

Make offer please (I really don't know what value is). First reasonable offer gets it. Will sell items seperately if no offers come in for whole package.

My Internet Address is anthony.dunleavy@compudata.com

: on a Postcript laserprinter ?

I have had good luck doing this by importing the 1st Word Plus
file into Pagestream as a formatted file (Pagestream has a built-in
module to do this) and printing from Pagestream. One problem is with
tabs. If you have a lot of tables or heavy tabbing, it's hard to get
that to come out in Pagestream. Otherwise most other formatting seems to
work.

Signum files are so special that I do not think there will be a converter.
You could, if you still have an Atari and Signum, save the files as ASCII
and then transfer.

MacMagic is still in development, not sure when it will be commercially
available. They say that Signum will run under it.

I hope you have set US letter size in the NVDI Printer CPX. If you have,
I can't help. But if you haven't, go to that CPX, click on the paper
size to get a menu of sizes, click several times on
the down arrow till the US letter size is visible (you only see three sizes
at a time, but eight or nine are available) and click on it.

Hi,

I haven't been using STs regularly lately but I recently picked up a 1040STFM and have been trying to get it working with an old SM204 hard disc. The problem is that the hard disc has a boot sector set up for a much older version of the machine and, for some reason, it bombs on the new machine. I now find the floppy on which I believe the boot intall program used to exist is unreadable. Can someone point me at a current copy of a program to install a workable boot or alternately to invalidate the boot sector so it can be booted from floppy? Otherwise I'm probably going to have to write a little program to invalidate the boot.

I _can_ access the disc alright if I switch it on after booting up the 1040 and then run adhi from floppy. This is obviously very clumbsy though and, since the system is intended for my mother, probably too clumbsy.

Malcolm

There's an .sdo -> .rtf converting program supplied with Papyrus. Check out
the demo version of Papyrus whether it's in there. Just run Papyrus and try
to open your Signum documents. You can then save them as .rtf which Word 5
should be able to read.

>If such an utility does not exists, please send more info about the Atari
>emulator for Mac. It has been made by the same society as Signum I think?

Correct. And AFAIK even Signum2 runs on the Mac using MagiCMac (the emulator)
in a special compatibility mode.

PCs with Linux don't support multiple processors; the Acorn, as far as
I understand Roger, does.

OTOH, I feel that PCs with Linux are at the moment what STs were in the
middle of the 80s.

>
>---
>* Kivi 1.21 *

The arrow keys do have ASCII codes, but they also have a length of 2. So if
you want to read the ASCII code you have to read the ASCII code of the
right most letter of the string. I don't know 'C', but if you are
familiar with Basic, this is how you would read an arrow key:

A$=inkey$ (read a key from the keyboard and store it in A$)
A=ASC(RIGHT$(A$,1)) (Find the ASCII code of the right most character
of A$ which is 2 chars in length)

Thus if the key you read from the keyboard happens to be an Arrow key, then
you will automatically be returned the correct ASCII code.

If you aren't familiar with Basic then I apologize if I wasn't any help.

But you can't say I didn't try!

Source record: 172703

Michael S. Smith (mikess@comtch.iea.com) wrote:
: I'm kind of new to Atari computers. Could anyone tell me what MiNT is?
Yes.
MiNT (MiNT is Not Tos, or, new version, Mint is Now TOS) is a (more like The Very First And Still Very Best) Multitasking
system for the ST. Original TOS is non-multitasking, and original GEM has a limited multitasking ability known as 'accessories'.
The Atari Official MultiTOS is based on MiNT, still using it together with something like MultiGEM or so.
Using MiNT you can run several programs at the same time, both WORKING.
So you can unpack a big .zoo and play a game/read a doc at the same time.
Theoretically, that is. Not very much games, and not all programs are MiNT compatible. You can use Mint to replace normal tos, and just run the desktop (GEM). However, you can't RUN programs at the same time using GEM.
There are several solutions to this. Either use an accessory that runs the programs for you (i.e. Toswin or gemterm) or don't use gem.
If you use toswin or gemterm, you can only run one GEM program (the desktop), but several .tos-programs. These don't use the GEM interface, so you don't use gem. If you don't use gem, you should use some other interface. Either a multitasking desktop (but these mostly come with there own multitasker, and are commercial (MiNT isn't)) or a command-shell.
There are many command-shells, most giving a Un*x like system, but you still can't run any gem-programs. Only tos.
For instance, I use MiNT and Minix (a replacement file system, giving your ST disks the same 'look' as unix) to set up my own net. To atari's linked, and a modem, using MiNTnet and the 'multi-user-setup' from the 'Mint distribution kit'. I can run internet-software, (like lynx, several tcp/ip terminals, etc No graphical www browser, though....:( ) but NO gem. (not with mint, anyway. I can disable mint in the auto-folder, and be running normal gem.)

: home ?

If you have a large enough hard disk, and a bit of a fast modem (or
plenty of time..:) and 9 dd disks to use, you can download 'the MiNT
Distribution Kit' from just about any good atari-site. Like
atari.archive.umich.edu... The MDK includes mint (0.95, but you can
'upgrade' it by using mint 1.12 instead.), Minix (file system, not
neccesary but VERY usefull...:) and loads of goodies, like shells and
stuff. It doesn't include MiNTnet though... FTP that too, + gzip, to
unpack it. tar is included in mdk....
Read some docs on the install and setup program, and it shouldn't be a
problem!
have fun, it works FINE (even on tos 1.0 if you should worry..:)

Yes, I am curious also. I have a Mega 4 STe and am considering a 68030
board in order to run Linux. What 68030 boards are available for the Mega ST
in the US, how much in US dollars, and I would also like to hear some
reactions on their installation. Is the installation simple on a Mega4?
How compatible is it with TOS programs, and for anyone who has already
installed Linux on it, what are your reactions?

Thanks for any comments.

p.s. also does anyone know where I can find the HSMODEM program?

This is not true, the Minix ST operating system (v1.1) was operational
(with multitasking, decent filesystem, multiuser support, etc) before
MiNT. Way, way, back in the mid 80's. Don't get me wrong I like MiNT
(especially MintNet, Minix still doesn't have decent networking :-( ).

[... some text deleted ...]

> For instance, I use MiNT and Minix (a replacement file system, giving

If you give info please be correct. Minix is a *OPERATING SYSTEM* a
version 7 un*x look-alike (trying to become POSIX compliant). You are
talking about the Minix Filesystem, which is a remake of the fs from
Minix (with some addition, I believe).

My aim is eventually (in about 6-12 months) to get a fax/modem. However I'd like to know what formats Straight fax accepts. For example can I scan an image and send it? Use .PAP docs etc?

I think Falcon prices here are lower than in the US, but not nearly as low as
£255. And if they were that would be about $350, not $200.

1067. Spectre GCR FAQ (we should make one!)

Newsgroup: comp.sys.atari.st
Date: 1995-01-24 14:53:38 UTC
From: ai066@FreeNet.Carleton.CA
Message-ID: <D2x01F.DEt@freenet.carleton.ca>
Source record: 172716

Like many Atari users, I have a Spectre GCR, and am always on the verge of asking questions of the Spectre net Gurus. Since Gadgets By Small is no more, and there seem to be quite a few Spectres still out there, we should put a FAQ together outlining tricks and tips, System reccomendations, Software known to function/not function under Spectre, Transferring SW from FTP sites to your Spectre, Printing, and all the other neat things that we need to know.

After reading some of the local Mac messages here on freenet, I have found that there are still a number of Users of Mac Pluses or Classics, which are the equivalent of Spectres. Of course, there might already be such a FAQ...

Eh?!

There's an NT version, and an Atari version. The Atari version runs fine on a
Mac under MagiCMac, but it's still an Atari program.

I am a member of CalamusUser magazine who have close links with DMC, and
neverEVER have I heard of a Mac-compiled/running version of Calamus. Ever.

I remember hearing Vic Lennard talking about Calamus SL on a Mac stand at
Germany's ProTos, but this was running under MagiCMac.

'Nuff said,

"Demise of Atari comments" ??? ... not from me, Eva. But I -would- be interested in the source of your other comment about Atari still -producing- Falcons. I thought the most recent production run occurred some months ago with no new production currently planned and that all sales were strictly out of existing (and supposedly ample) inventory. Atari's manufacturing facilities are leased in Taiwan on an as needed basis as they don't have the volume to keep one going full time.

What's the story?

Since this might be a common enough question I figured I'd post the
answer.

All you need to do is rename mint.prg from the distribution to
mintnp.prg. This signals MiNT to run without memory protection, which it
must since you are running on a 680_0_0 rather than a 680_3_0.

And don't rename it to mintp.prg, because it just doesn't work right
that way. Trust me, I know :-)

The ST port is bi-directional, as you can get some samplers and stuff which
squirt stuff into the port.

As for control lines, going by the manual the ST only has the ^STROBE and
BUSY conrol lines, which are the only essential ones. There are
many more than this on some computers like Amiga and PCs, such as
ACK, RST, and all sorts of stuff that arn't really needed.
Or in fact they MIGHT be there, but the manual just doesn't say so!

Try installing a Desktop drive icon with the letter 'c' (Small c).
Then double click it and you might be able to see the files on the ROM.

I've had this problem too, configuring NVDI to A4 (Which I use.) is of no help, I still get the "printer does not support this paper size". I solved it by choosing "Set size to current printer" in the Page Layout dialog in Works. Now everything works just fine.

A friend of mine has just bought a Star LC24-200 Colour dot matrix printer for his Atari STE, does he require a printer driver to print text and graphics (in B&W and Colour). If he does has anyone got one?

Please could you respond to me by e-mail, since I do not visit this newsgroup very frequently.

Many thanks in anticipation.

1079. Atari speech syntesizer V.2 ?

Newsgroup: comp.sys.atari.st
Date: 1995-01-24 19:13:44 UTC
From: olava@ilf.uio.no
Message-ID: <olava-2401952013440001@macus73.uio.no>
Source record: 172725

I have a little program that converts text into kind of speech.
The first line says Atari speech syntesizer V.2.0.

Is this an application that has programmed text - speech conversion from scratch, i.e. using only sound driver, or has the atari st520 som routines for text speech conversion built-in?

If this is the case, which simple programming environment can call these routines ? ST BASIC, GFA BASIC, some SCHEME, which of them can be programmed and run from a 720k disk?

Are there other possiblities for alternative output?

thanks,
olav-andreas

Source record: 172726

re. Astropanic 94! rev.c.

Well now it doesn't work on my 1040STe either. It appears that
for some reason my pointers are getting scrambled. I am digging into
it. It does however seem to work fine on Falcons oddly enough. There
have also been problems with TT's. So I am going back into it and should
have a rev.d. out soon. This one also will handle the timing a litle
differently so that on slower machines; the game won't bog down if you
move your mouse constantly. And hopefully if I can get these pointers
fixed easily, I will have support for digitized sounds on machines
without DMA sound systems.

On a side note here. has anyone had any luck getting Lattice to
drive the play_repeat enable on the Falcon sound system?

>for our computers.

Nothing is wrong in making profit. Only problem is, the Atari market
is so low, that if you want to make profit, you'll perhaps end up
lowering the market rather than increase it. And then they'll destroy
their own buisness as well.
There is a different in making profit and to live from your sales.

>It's not the developer's job to create the market for a new computer.

It sure is..

>Why should a developer invest considerable effort into the Falcon
>market if not even Atari really supports it?

Look at the message i wrote two days ago, (i think it was an reply to
Hendrik's message), and then start think about it.

>Because Atari was too late with the TT, too late with the Falcon,
>and did not build on their strengths as they should have. In retrospective,
>virtually nothing happened at Atari during 1985-1989 in terms of
>system software and new (released!) hardware.

Agree, but after that there came the MSTE, TT and now the Falcon. All three
has faild in software support. Maybe you should twist the picture here, and
start ask why Atari did the TT/Falcon at all, when noone was interested in
supporting it with software.

>When the Falcon was released, the Atari market already was in a very
>bad shape, and many developers were looking for alternatives (including
>yours truly). The disappointing Falcon support was the consequence,
>not the cause of the demise of Atari.

So ? Now you agree that the developers did leave. Not Atari.

>
>And, BTW: I generally don't buy the hypothesis that it's the developers
>who are at fault. The bulk of the problem lies at Atari, nowhere else.
>In 1985, they had a system which was better than everything else on
>the market, both from the system software and the hardware point of
>view (well, the Mac had a slight edge in software, but not really one

>software was ahead of its time, and GEM seemed to become the de facto
>UI standard even on the PC. Atari just didn't follow up, and
>the competition didn't sleep.

That really has nothing to do with the lack of software support for the
Falcon now. No matter what many of the programmers think, the only thing
which is going to push the Falcon out of the market, is when there are
no software to support it. Look at the way the PC is beeing distributed.

>
>To sum it up: I do understand why the lack of Falcon support upsets
>you. I would probably feel the same if I had a Falcon. But on the
>other hand, you have to understand the people who are still in the
>Atari market, trying to make a living from their work.
>

I can understand that very well, but not if they're trying to make profit.
Which is what i spot on many applications.

Greets

STraight FAX! works with .IMG, Degas, GEM, ASCII, 1st Word/Wordwriter,
PCX, and FAX format files. FAX files can be generated using one of several
custom printer drivers included with STraight FAX!

At this time, STraight FAX! supports:

Calamus (all versions), PageStream, Speedo GDOS, NVDI, AtariWorks,
Papyrus, That's Write, and several others. Also, it can of course
FAX an IMG file, so if you have an IMG driver for a program, you
can FAX it with STraight FAX!

If you have other questions about STraight FAX!, send e-mail to
toad@charm.net or c.s.smeton@genie.geis.com. Or check out our
home page at http://www.charm.net/~toad/.

> I was wondering if anyone could tell me the pros and cons of Pure C and
> Lattice C. From the descriptions, they seem roughly equivalent.
>
> Thanks,
> --

I have both Lattice C and Pure C.

Lattice C has much better utility libraries than Pure C. The manuals are in english. And I think it has a better editor. Pure C has on-line help (though in German, but there is a company selling an English version), a Source Level Debugger and is faster at compiling. THe code generated between the two is about the same. Lattice comes with a debugger, but it is assembler with C source mixed (not as nice as Pure C). Lattice comes with a Resource Editor and Profiler, Pure-C doesn't come with either. Lattice is less expensive.

If Source Level Debugging is the must, go Pure C. If not, go Lattice.

>I have a cartridge for the ST called "DeskCart!" by QMI (Quantum Microsystems Inc.) ...

John,

I've owned the DeskCart since it was developed. (The owner of QMI was a neighbor and fellow ST Club member.) QMI went out of business about 7 or 8 years ago, and made much of its commercial stuff PD at that time. I'll be glad to help you with the DeskCart support software, which is useless without DeskCart anyway.

Send me e-mail and let me know where to send a disk.

> I'd like to know what formats Straight fax accepts.

Rod, STFAX can import IMG, 1stWord, straight ASCII, and a bunch of other formats. You can scan an image and import the scan into STFAX as long as the image is a standard one (we use IMG here with STFAX, but I also think STFAX has added TIFF documents to its list of importable formats). STFAX's own format is supported by GDOS printer drivers that work with (for example) Calligrapher, Calamus SL, That's Write (II and III), Papyrus and other word- and document-processors.

I still need help but thought I'd update the situation. I messed around
with makeprn.app and managed to change the dimensions of a page to
work (took all margins off of paper and redefined the page dimensions).
I also got the "CJ" to stop appearing by adding a NUL command in my
start page character control. Surely, though, there must be a better way
to do this! The CJ is in the vertical carriage command line. Why does it
print?! Also, when printing with AtariWorks I find that program asks
for the next page while the printer stops somewhere at the end of the page.
Somehow the dimensions are messed up.
Could someone please, _please_ help? I would be very grateful as I know
of no way to easily switch back to Speedo. I need to be able to print
with my computer.

>Or maybe it's only possible with columns...

Free page layouts are done based on columns:
- create the number of columns/text frames you need
- go to the master page (i.e. by clicking on the header line)
- now you can rearrange and resize the column frames as needed

1094. MiNTnet/MiNTos XWindow etc. Queries

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 01:15:54 UTC
From: mbecroft@iconz.co.nz
Message-ID: <3g48oa$93o@status>
Source record: 172741

Firstly, this is my first post on Usenet, so forgive me if I have sent it wrong.

Anyhow, I have a number of questions regarding MiNTnet, MiNTos, MiNT Xwindows, minixfs and related programs:

First, I have no idea what MiNTnet, MiNTos are. What are they, and what can they be used for?

I know minix lets you have long filenames. What else does it do? Do I need MiNTnet/MiNTos to run minixfs? Will my existing software still run under MiNT 1.12/Minix/MiNTos/MiNTnet?

If I have MiNTnet/MiNTos/Minix/X Window, will I still be using the GEM.SYS from MultiTOS? Will I still be able to Multitask while running these things?

I guess MiNTnet does networking. Does this set up a logical drive and have all other computers listed as sundirectories? Or does it work in a toally different way?

I currently use MiNT 1.12 with MultiTOS on a TT030 32Mhz 8meg RAM FPU68882.

I guess there is an FAQ or something somewhere that tells you all this, but if there is I could not find it. Apologies if all this is common knowledge and I am just using up room on Usenet for `stupid' questions :-)

Thanks very much for any help,

Thanks VERY much for such a detailed, information-packed reply.
I've learned a few years of ST in a few minutes. Looks like the Falcon
030 is the way to go!!! I'm all for that thing.

I went into the OSU library today and looked up the (I think)
Feb. '93 Byte, where they had a "First Look" at the Falcon 030. What was
written was ONE page, not enough to constitute a full review. However,
they said some pretty nice things about it, which is surprising for a PC
rag like Byte.

I was surprised to see that it looks *EXACTLY* like the original
1040ST. A novice could hardly tell them apart. They applauded the fact
that you can hook up **ANYTHING** be it a synth, camcorder, VGA monitor,
anything with RCA phono plugs...etc. to the Falcon. That's what I like.
They gave a price of 1Mb/1.44Mb (no hd) for $799 and (I beleive)
4Mb/65Mb was something on the order of $1200 - back in early '93. I'd
expect they come with bigger hard drives now, eh? It's only a matter of
time until I can scarf one of those for the Atari collection. Does
anybody know if they ever swapped to larger hard drives? Is it easy to
upgrade the hard drive? Is there a "CMOS" memory setting like on a PC??
Seems like with IDE hard drives over 500MB only 1" high...it would fit in
there. Cheap, too... I heard Sam's club was selling 1GB IDE drives for

around $450. Be nice to toss one of those in a Falcon.

Be nice to get a TT...just for collector's sake. I just remember hearing rumors of the TT for so long when I first got my ST....wanted one SO BAD that somewhere in my heart, the yearing rages unsatisfied....ho hum....

James

1096. Any Atari hard/software sites near Atlanta..???

Do you have some asm. source to do this that you could share? Please =8-]

>In principle you can connect two ST's with the datalines tied 'one-on-one'
>together, but chances are you blow out one of the ports (or both). For
>safety I placed some 1k resistores in series with each dataline. You will
>have to cross connect the strobe and busy lines.

I have my ST and 130XE (8bit Atari) connected up with the 8data lines going
to the 8data lines on the 2 j/sticks of the XE (i.e. 4lines each), which
are port A of the XE's PIA chip. I use the 8th bit as a sort of strobe -
I set it low with the data on pins 0-6, then set it high, then low again.
I found this was ideal as the pins seemed to require time to settle - that's
how it appeared anyway. I presume I needed to hook up the grounds too so
that they have the same reference (or something), which was a pain, as then
I couldn't use old joystick cables (which don't have ground connected).
I have a switch that goes across the BUSY line and ground - so that it's
either ground or floating (seems to work ok).

>When using the port for input (with TOS) through the Bconin call (BIOS 2)
>the port is automatically switched to input.
>The performance through TOS Bios routines is low, say about 1kb per
>second...

Yeah - I get about 290bytes per second - which is actually 290*3 (as I send
the byte 3 times with the MSB toggled (as stated above).

This works most of the time - occaisionally I need to re-transfer stuff,
but it has worked and once "warmed-up" transfers without error.

Is there a way to bypass the routines? Do I just write directly to the chip
or something? Is there a vector or something? Or is the chip in the same
location on every 16/32 bit Atari? And once again, would you happen to have
any source for this?

One last thing, I unfortunately have to change the BUSY line by hand (switch)
this means that I can't send data in the opposite direction automatically,
e.g. for ACKnowledging data...

Your advice is appreciated,
Richard =8-]

1102. SM204 autoboot help needed

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 08:41:26 UTC
From: malcolm@pigsty.demon.co.uk
Message-ID: <73055810wnr@pigsty.demon.co.uk>
Source record: 172749
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

(Sorry if this gets double posted but I thing my news system lost my first attempt.)

A few years back I used to program an ST profesionally though I've since been forced into the clone camp. Anyway I recently bought a second hand 1040stfm for my mother, thinking that I had lot's of software and a hard disc I could let her have.

I have a problem though with the SM204 hard disc. It appears that the boot sector I put on it many years back is either corrupt or incompatible with the 1040. If I switch the ST on after the disc is up to speed it bombs and locks as it tries to boot. I can access the disc OK by powering it up after booting and running the driver from floppy.

Obviously I need either to put a valid boot program on the hard disc (my first choice) or, if necessary, invalidate the one which is there. The trouble is that I can't locate the little program which set up the boot sector. If the worst comes to the worst I'll have to write a little program to clobber the boot (invalidate the checksum) but someone must have a copy of the boot sector program out there. I've looked on several archives without success - I can't use archie because I've no idea of the filename.

> Are there other possiblities for alternative output?

I was playing with that very program last night & there was another
program with it that acted like a front end; you could specify on a
command line some options like:

-f (file) = speaks that file.NB Control characters cause problems)
There was also a way to get it to speak whatever you typed.

You could also get it to redirect the output to a file (I think it does
some limited character filtering).

AFAIR this program was called TALK.TOS & it called SPEECH.TOS.

I remember a few demos that called SPEECH.TOS from basic.
I don't believe the ST has any special text to speech routines inbuilt.

1104. Neodesk4 3DIcons out!

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 08:58:00 UTC
From: Dan.Dreibelbis@balmybeach.gryn.org
Message-ID: <b27_9501251942@tor250.org>
Source record: 172641

Just wanted to tell you all that I've just released my fourth collection of my 3DIcons for Neodesk on GEnie. These are my first set that take advantage of the capabilities of Neodesk4, as they're animated! (especially check out my "trashcan" and the modified ".S" <source code> icons. I've also included some mono tiles for use as wallpaper in .IMG format. Hopefully some kind soul will make them available on the Internet soon. It'll be marked 3DICONS4.ZIP.

I'm also hoping to have the new ST GUIDE version of the ATARI GLOSSARY (done with the cooperation and blessing of the Glossary's author, Howard Carson) out within the next month or so. Howard's glossary is a great source of info for Atari users, and by turning it into a hypertext I feel I've made a good idea better! It'll also feature some illustrations within it. I should be also starting soon on doing an ST Guide version of Howard's GIANT COMPUTER GLOSSARY.

MY bit for the Atari community......

It works on EVERY screen, every Falcon. You should download the last version (sbm.zip, on ftp.cnam.fr, /pub/Atari/Games, or on ftp.uni-kl.de, /pub3/atari/games). If it still doesn't work normally, try it after booting with <control> key down, and please, send me the configuration in which it doesn't work...

Unfortunately that couldn't be the cause. MINT.PRG and MINTNP.PRG are
the same program. When MiNT starts, it searches for itself with the
name MINTNP.PRG and if it finds it, it'll disable memory protection.
However, it can detect if it's running on a machine which is not
capable of memory protection (like a 68000) and turns memory
protection off automatically in that case.

If the only part of MiNT that's been installed is MINT.PRG, I suggest
you try taking a close look at your AUTO folder, and disable anything
that's not completely necessary to start your system up, to see if
anything's conflicting with MiNT.

If the installation procedure has created a MINT folder on your boot
disk, try moving the files from that to somewhere else, in case they
are not working properly. Try booting with no \MINT\MINT.CNF.

Try re-extracting MINT.PRG from the archive in case it became
corrupted when it was copied to the AUTO folder.

From: mluoto@cc.Helsinki.FI
Message-ID: <3g5alf$sim@oravannahka.Helsinki.FI>
Source record: 172655

So, I've got one for sale...

ie. it is/has:
-goes to vme-bus slot, leaving the two serial interfaces
still useable... (in case you like all four ;-)

-Very compatible with all programs, haven't found a
program yet that would not work at least in normal
mode (autoswitch)

-fast, works fine with NVDI etc...

-expands the vga or alike resolutions up to 835 x 600
or something very close to that...

Doesn't cost much, asking for $80 or equivalent... or the best
offer (this is 30% of what it costed new in Germany)

I went into Digital Village the other day and they had a pre-release
version working. It still had the Atari badge on it, 'cos the C-Lab ones
hadn't come in yet.

It had the hardware audio mods done, and contained an internal SCSI drive
rather than an IDE, but otherwise...

>Does C-Lab have a UK office? if so does anyone have the address

Let's have a look into the "Profibook", the german ST bible (short version):

On the parallel port (parallel, _NOT_ Centronics, because some lines f.i.
Papaer out are missing) you have the following lines:

pin 2 - 9 : DATA #0 - #7
pin 1 : Strobe out
pin 11 : Busy in
pin 18-25 : Ground

The data lines are generated by I/O-Port B of the PGS (Programmable Sound
Generator).
The data strobe out line is genarated by I/O-port A bit #5 of the PSG
(remember: counting bits starts with #0 !!)
The busy in line is connected to I0 (Input #0) _AND_ TAI (Timer-A-Input)
of the MFP (Multi-function Peripheral), 1kOhm pull-up to 5V.

The strobe line informs the Printer that the data lines are valid. Data
is taken with the raising strobe signal. The strobe line has to be set by
the program, it is _NOT_ genarated automatically.
The busy line informs the computer, that the printer needs some more
time, i.e. busy doing something.
You can read out the busy line or have an interupt genarated.

The port can be used for both directions !! (To my mind, PCs are not able
to do so)

Output _AND_ Input via the parallel port is fully supported by the system.
You can use the BIOS functions Bconout (BIOS #1) Bconin (BIOS #2) and
Bconstat (BIOS #0) with device 0 (= PRT = parallel port)
The transfer rate is about 4000 bytes/second.

Each line is able to drive one standart TTL load.
You get problems with some older printers, because they might have to low
pull-ups to 5V, so the current needed to force a data line becomes to

high for the PSG (current should be lower than three mA).
Attantion: On the power up of the ST port B of the PSG is set to output!
The line are set to low.
So if you want to use the parallel port as a input device, the sender
mustn't make a connection before the parallel port is set to input.
Otherwise you will get a conflict if one of the lines is set to different
voltage (by the sender and by the not-ready-or-not-configured ST).
The first thing that will happen is having a reason to go to your local
electronic shop... i.e. your PSG is blown away (not _blown_ away, but
fully out of order).

Hope it helps
Sorry for my english

I tried the original sbm as well, and got the same result. BUT, after
the author's hard done by winge, I DL'ed the new version, and have to say
that it is absolutely wonderful. It does work on SVGA now.

I've not had a chance to get a few mates in on it yet, but I'll certainly
check it out some more.

6 Players at once (two on joystick, two on keyboard, two on Jag Joypads)
should be cool. The GFX are almost arcade perfect. The sound is just a MOD
at the moment (uses BitMaster's DSP modplayer), so some natty explosion
noises & stuff are what's needed to make this a really top class arcade
convertion well worth the asking price. (It could do with some computer
controlled characters though, you need at least two people to play it).

One bug - it always crashes my machine when you select quit......

Craig.

>GEM++).

Or DULIB.....can any of my CLA3 beta testers back me up here ? :)

Toolbars in a window with something else aren't at all difficult really,
you just need to approach it from the right angle.....though they need
coding into the GUI Library you use. It is unfortunate that Atari never
thought to extend the Library support offered in the GEM libraries in a
manner that allowed them to be used on all machines regardless of OS,
because as it stands, although TOS4.xx provides almost all the toolbar,
iconify, popup & cascaded menu facilities you could wish for (although
scrolled lists don't appear :( ), no one in their rigth mind is going
to use them simply because they rely on inbuilt OS routines, which aren't
present on most (ie not falcon) machines.

This could have been avoided if Atari had thought to provide a WinX
style AES patch program which retro-fitted the extra functionality to
older TOS versions......water under the bridge, we'll have to make do
with larger executables now, as most apps now include most of their GUI
code in the executable instead of using the AES direct.

Shared libs?

Craig.

: (Depends on how desperate you are)

Ummm No it's not any more!
Paragon Computers closed its doors late 1994 (I forget the month - October?) for various reasons including:
- general decline of Atari market
- Australian Federal govt imposition of a games classification system which required Paragon to have each Atari game separately classified and thereby skyrocketed prices to unrealistic levels given the low volumes
- Atari Oz closing, meaning that hardware had to be sourced from the Netherlands with the dealer (Paragon) wearing 100% of the warranty risk in the event of a failure - _even_ if D.O.A! Unacceptable to a small business!
etc etc

Phil & Hannah Reeves will be sorely missed in the WA (and Australia) Atari community...

1124. RE. 2.5Mb simm problems

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 14:48:43 UTC
From: gccornelius@its.dundee.ac.uk
Message-ID: <gccornelius.2.2F2664CB@its.dundee.ac.uk>
Source record: 172669

In a day or two I'll upload the program I wrote when I upgraded my Ste to 2.5Mb. It'll do the job you want. I've always had 100% compatibility with it. It also lets you reconfigure to less memory if you want. It is reset proof. Its only 520 bytes long ('cos it's written in machine code), and has a couple of nice menus, etc. When I've found out where and when to upload it, i'll post another notice here. I really should have got round to this earlier, because it must be about 4 years old now.

Graham Cornelius, Student in Dept. psychedelics,Uni of Dundee.

A FAQ, (Frequently Asked Questions) is a text file that has the answers
for most of the questions that new readers of Newsgroups tend to ask.
Currently, We have Atari FAQ's on CD Roms, Mint, General info, and a few
others, which are avilable for FTP on the Net. Since There will be no
more support of Spectre by Dave Small, we should put a FAQ together as a
resource for all Atari Spectre users.

From: harun@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3g5po5$35j@mars.fb1.fhtw-berlin.de>
Source record: 172684

If you need only a second, and not a third, serial port, use the LAN-port.
It has more control lines then a MFP-modification, which has NO (0)
of them.

Regards, HS

1127. Interlaced GIF images

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 15:19:54 UTC
From: frank@tachyon.demon.co.uk
Message-ID: <791047194snz@tachyon.demon.co.uk>
Source record: 172675

Does anyone know of any ST-compatible software which will either save a GIF image in Interlaced format, or something to convert a standard GIF to an interlaced one? I want to be able to interlace GIFs for my webpage authoring, as Netscape on the Mac etc. will download them gradually if they're interlaced, giving you a preview.

Cheers,
Frank.

: tos 1.4 and a 105mg hd. I would like to run both but I don't want to try
: logical sectoring 'cuz the icd book says that it won't run a lot of programs.
: So I thought that maybe tos 2.x and above would help.

TOS 1.04 should have no problem with 32 meg partitions. I believe you can
have up to 14, 32 meg partions mounted at any time, meaning you should be
able to mount most of your hard drive space at any one time. Of course,
the partitions are still going to be rather small. You should use logical
sectoring; the programs ICD refers to as not working are by and large
hard drive utilities, and if you have ICD's you usually won't need anyone
else's. Normal applications will work just fine.

The machine is a Falcon. It was designed by Atari.

C-Lab have a license to build and modify it.

The initial version is an Atari Falcon + Atari Hardware mods + SCSI hard
drive. With a C-Lab badge.

>Are Atari (or its sub-contractors) building the machines for C-Lab?

Dunno. I'd guess that at the moment, C-Lab were given a batch of Falcons
to modify, but at a later date they'd be building better versions.

>Also what enhancements are built in ie, TOS 5 etc?

None.

1135. Can old 1040ST run w/9600 baud Modem?

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 19:57:13 UTC
From: jgholm@paradigm.crhc.uiuc.edu
Message-ID: <3g6aep$kb0@paradigm.crhc.uiuc.edu>
Source record: 172690

I have a 1040ST that I got in 1983. It has 1MB memory and no hard drive. I just use the internal floppy. I've been using it mostly as a terminal with Flash 1.2. Recently, I upgraded from a 1200 baud Racal-Vadic modem to a 14,400 baud modem. I know that Flash 1.2 only has settings for 9,600 baud, but I figured that would be fast enough for simple dial ups.

Unfortunately, when I run at 9,600 baud I lose a lot of characters. Has anyone else had this problem? I think that the software or the computer cannot keep up with this data rate. It can cause some interesting displays when control characters are lost.

If anyone else has had this problem and solved it please let me know. Pointers to better modem software that can handle the speed would be useful.

Email is best. I'll watch for follow-up posts as well.

Thanks,

John Holm

Sorry, I don't know what "available for FTP on the Net," but then I'm a lamer when it comes to the Internet. It's a real challenge for me to access the Usenet. In any case, I have a lot of experience trying to get Spectre GCR to work on an Atari Mega STe w/50mb HD and 4 mb RAM. Believe me, Spectre does not work as well on a Mega STe as it does with a standard ST. (Flamers and Dave Small appologists, save your breath. I have had problems, and I know of many others with a Mega STe who have had similar problems, so please don't tell me about how well it works on your computer.) In any case, I have learned quite a few tricks to make Spectre GCR work on my computer, and would be happy to share those. --Mark van Wyk, home E-mail address: Markvanwyk@AOL.COM

: well, and if any US firms can match it......I really want one too, but 1k is
: outta my range....
I don't know about the price, but:
1) 255 pounds is NOT 200 US$, more like 400 us$.
2) Anyone wanting a 1 meg falcon hasn't been listening.
Some of the true-color modes take half the memory, leaving very little
for a computer that has been designed and sold with 14megs... I don't
think you can run much on THAT. Unless you use a VRmem program, but I
don't know any, either on the ST or falcon. Better think twice before you
buy something like that....:)

1147. ST Software on CDROM mag!

Newsgroup: comp.sys.atari.st
Date: 1995-01-25 23:40:00 UTC
From: Dan.Dreibelbis@balmybeach.gryn.org
Message-ID: <862_9501261048@tor250.org>
Source record: 172614

I've just noticed an interesting turn in the British CD-ROM
cover disk wars....

As you probably know, the Brit magazine FUTURE MUSIC has been
placing on their front cover a CD for the last year or so, and for
the last few months they've been dedicating track1 as a CD-ROM
accessible sector, but mostly for PC and Mac users (although they do
include sysex files and .MID files that Atari users can utilize -
they've been advertising this as "we come in peace" to ST and Falcon
users with CD-ROM drives).

Well, now a competitor, THE MIX magazine (done by Music Maker,
the same publisher of GUITARIST, the excellent British guitar mag)
is now also offering a CD on the cover with a CD-ROM track - and
they're offering Atari PD/Shareware software!

And in an ad for FUTURE in one of their sister magazines, it
mentions that FUTURE MUSIC's next issue (due any day now on the
stands) will be offering Atari software as well!

Have THAT many Atari users embraced the new technology so much
that the magazines now have to notice it? (FUTURE had been a bit
critical of Atari's ability to cut it in today's MIDI market for a
few issues last year).

This should make for an interesting next couple of months....

... REAL oatmeal should be thick enough to stop a bullet!

1150. Questions

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 01:20:08 UTC
From: simon@bassland.demon.co.uk
Message-ID: <791083208snz@bassland.demon.co.uk>
Source record: 172697

Okay, here are a few questions about various things

I have Atari NOS running my Internet connection, what is MiNT/Lynx, I've heard it is quicker, etc. I know I can get it from most FTP sites, but what files do I need?

There are rumers about TOS 5.0, when is it going to be available?

When is the Medusa 040, or the Eagle going to be available and what is their technical spec?

When I buy a Falcon, I wish to get AtariWorks with SpeedoGDOS. What would be the best version of NVDI (3.0?), and does it support vector fonts/ TrueType fonts? What is the largest partition size on the falcon, if I buy an external SCSI Hard Disk?

What monitor/falcon config do I require to get TrueColour (65535 cols) mode on my falcon at 640x400 resolution? I have just bought Hisofts TruePaint, and the screen shots are from 320x200x65535 colours, and 640x400x65535 colours. Do I require an RGB monitor or a SVGA monitor?

How fast does the standard 1040ST run at in MIPS? (The falcon runs at 3.8 MIPS, and its DSP chip runs at about 16 MIPS.)

Cheers.....

1152. Re: Time to put my 1040STf out to pasture?

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 01:27:02 UTC
From: simon@bassland.demon.co.uk
Message-ID: <791083622snz@bassland.demon.co.uk>
Source record: 172698

I use a standard 1040STf, which works fine for my Internet Connection.
However you will need a HD with at least a 10Mbs of space free to have a
"comfortable" setup. Yes I know I have extra RAM, but 1Mb should be fine.
I also use a US Robotics 14,400 baud modem, which is very fast. (but there
are quicker ones)....

Oh, you could buy my whole system off of me if you like! Seriously though,
I am selling it, to buy a Falcon, I already have a Mac and a PC too.
(Notice I don't mention that below, PCs work fast, and they're cheap,
buy they're also very NON-user-friendly, so don't get one.)

Bye, bye...

>ever have one in any of its newer updates..Well thanks again eric.

Shareware/Commercialware author Damien M Jones did a freeware vt52 file creator a few years back, it's excellent! Although not mouse driven like Fansi, it is really reliable and easy-to-learn...

Can't remember the name now, since its been so long since i needed a VT52 screen for any purpose, but its great all the same and probably on an ST-BBS near you! :)

> Cubase ? How do the prices compare?
> Thanks,
> Paul

I don't know why you are having trouble getting it but I know it's
available so maybe you should try another dealer. Call TOAD at
1-800-448-8623. They have it in their catalog for $799. Of course
that is in the USA.

Logic Audio Falcon is no more (at this point). EMAGIC has decided not
to support the Falcon with that product and offered it FREE to all
Logic Falcon users with the knowledge that there would no support or
updates, EVER. Too bad too. I managed to get it and it's really a
nice product although it doesn't have the Reverb/Chorus/Mixer
functions of Cubase. It has a nice mixer capability though.
I suppose you could always buy Logic and get someone to give Audio to
go with it.....................

> uld finish
> it.

I am GUILTY as charged !!
I procrastinated in sending this and I am sorry.
I and my roomates 2 children (6 & 9 years old) play SBM regularly and
LOVE IT !! I like games that dont involve a lot of strategy and weeks
or months of playing time to finish. I just don't have time for them.
I like quick and easy distractions. SBM is that. And the fact that
you can have multiple players is even better. They are limtied
multi-player games around and to me that is part of the fun in
playing games. Man against Man. I will be waiting patiently for the
finished version whether it be Shareware or Commercial and will among
the first to buy it (if I don't put it off to long <G>).

Dont' be too discouraged. I've found that a good portion of the Atari
community is sluggish and irresponsible. Like most computer owners.
And a lot of them only want something for nothing. Well I guess that
pretty much describes the Human Race Huh ?

Anything I can do, just ask.

> else's. Normal applications will work just fine.

You should have no trouble with partition sizes up to 32Mb with ICD and
TOS 1.4 and if you use BGM partitions, they should be able to go up to
512Mb.

You can have up to 14 active partitions out of a maximum of 128 (that
ICD can manage for you), so in theory, you should be able to handle a
window size of 7Gb out of a total of 64Gb at any one time.

Cheers for now, Martin.

Why not just Fix it, PSU's on Ataries are very simple, there is a resistor
on STE PSU that goes O/C, 470k 1/4W Replace this with a 3/4W resistor
or 2 220k 1.2W ones, far cheaper don't you think....

1163. 1040ST

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 04:37:12 UTC
From: rharris@rt66.com
Message-ID: <rharris-2501952035540001@rharris.rt66.com>
Source record: 172608

I recently acquired a used 1040ST. Perhaps, someone out there would be kind enough to answer a few dumb questions for me:

1. Does the 1040 connect to a standard SCSI hard drive? I have a SCSI case with Centronics connectors and drive. If so, where can a connector cable be found? If not, where can a drive be found?

2. Is there a program which will allow either a Mac or PC (I have both) to write to an Atari format?

3. Where can a replacement mouse be found (mine works, but turns a bit roughly).

Any answers would be greatly appreciated - either posted here, or through E-mail - thanks.

Bob Harris

PLEASE PLEASE chaps when you place a file on your Archive site,
make sure that people can access via Gopher..

Most sites don't reconise .MSA .TOS etc file extentions,
A.A does Hensa does not like .MSA, CS.TU-BERLIN.DE I think
support all, but they do fix it very fast when I have asked...

I did ask UNI-KL.DE some time back but the never did a thing....

So can some one help and place STNEWS 93-2 on a site that I can get
to it via Gopher.....

Also using a Lynx browser is also a Big problem, even simple
ZIP files can be listed a TEXT....

So think befor you upload that file....!!!

1168. Using Minix (?)

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 08:54:29 UTC
From: andrew@minster.york.ac.uk
Message-ID: <791110469.15916@minster.york.ac.uk>
Source record: 172616

Hi, I've been trying to use minix/fs on my Falcon for some time.

I've recently upgraded to Mint 1.12 and I've got minixfs v6/pl9.

I've created a minix floppy disk and I've written files to this
disk whilst in tcsh v6... However when I 'ls' this files I only
get max 8 characters in the filename.

Am I using a bad version of ls or have I created the minix disk wrong?

Can someone tell me the best (most unix-like) setup for a minix file space?

I also need to know which shell is best to use for mint and which toolkit to
grab hold of. I'm sure I could compile most of the toolkit myself once I've
got started.

I've tried reading some of the FAQ's but I'm sure they gloss over this type
of setup.

That's probably an old demo that wasn't meant to be spread. I've talked to Team Computer and have just uploaded NEONDEMO.ZIP at ftp.cnam.fr/Incoming. Hopefully the guys there will get it into Falcon/Graphics soon. It's a *working* demo that definately works on my 4.04/FPU setup.

Wordperfect for the ST can sometimes be had used. Also ask Toad or other mailorder dealers - they'll likely be able to find a copy on a back shelf.

>I think the last release was version 4.1. I haven't seen anyone offering
>old copies for sale in a long while.
>
>|>Or else a package that converts WP PC to, say, 1wordplus, or something
>|>like that. My sister is in desparate need of such a package (preferable

What exactly do you want to do? I have WP for the Atari - if you have only a few files to convert, I might beable to do so for you. Or maybe you can save the files as ASCII and import them that way. Most of the time some aspect of the text formatting is lost in translation anyway. Then you wind up going in and re-formatting your imported text by hand - tedious, but easier than re-typing the whole thing.

1171. TOS IMAGE to INTEL HEX....

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 10:09:07 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3g7sc3$qem@golem.wcc.govt.nz>
Source record: 172626
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi,

are there any programs out their to convert TOS IMAGE
files to Intel HEX format..

I have access to a PC prom burner, but it only handles INTEL HEX
format files, so I need a coverter, is there one...???

Thanks.....

Source record: 172649

Does anyone get ST Applications from the FaST Club - recently they trimmed down its size and said "get ST Review, our new format doesn't clash with what they do". After ST Review got sold, they said that they might increase to a larger size to cover what ST Review used to do.

If they do this why don't they get together with Ofir & Co. and launch ST Applications in the highstreet? They could probably do well without Ofir & Co. as the magazine would still be the same, it would just have a wider audience.

1173. Gopher Problems with UNI-STUTTGART

>I am looking for some utility program running on Mac which should allow
>for a SIGNUM II -> WORD 5 file format translation.

AFAIK, no such tool exists.

>If such an utility does not exists, please send more info about the Atari
>emulator for Mac. It has been made by the same society as Signum I think?

It is distributed by ASH, the same folks responsible for Signum!1, 2, and 3.

The actual MagiCMac development was done by Thomas Tempelmann, Andreas 'KAOS`
Kromke, and 'NVDI`-2B.

[snip]

Further questions and other information can be posted to the ASH
CompuServe account 100067.3712@COMPUSERVE.COM

...

Q: Does Signum!2 run with MagiCMac?
A: This is the question we hear more frequently than any other. And much to
everybody's surprise the answer is : Yes, it does run. Because under
MagiCMac there is a special 640x400 monochrome mode which allows to run
even older applications. If you want to print from Signum!2 you have to
redirect the output to a file (with the tool PREMUL) which you later drag
onto the printer.

>in hte upper-left hand corner of my document. I also get a messege

This sounds like a unknown command being send to the printer. In which mode do you use the BJ? In its own mode or an emulation of some kind?

You can compare the codes used for that specific printer with the MAKEPRN.APP that comes with NVDI 3. Take a look in your printer's manual to check out possible wrong commands.

>when getting ready to print that the defined area of the page is larger

: Thanx you very much!!!

Hi!

Connecting a MFM harddrive to an Atari is easily done, I've done it myself.

Since I'm not aware of a third-party MFM-controller for the Atari, you
will need a SCSI-controller, and a SCSI to MFM converter.
The one I used is an Adaptec ACB-4000 together with a Megafile 44
SCSI-controller (Atari) aswell as ICD's AdSCSI and The Link.

The other way you can go about, is to get a Megafile 20/30, since it has
got an MFM-controller.

Good Luck!

Regards, Tommy

Source record: 172632

G'day from the land downunder Bob!

: 1. Does the 1040 connect to a standard SCSI hard drive? I have a SCSI case
: with Centronics connectors and drive. If so, where can a connector cable
: be found? If not, where can a drive be found?

the ST will connect to any SCSI drive provided you have an adapter called
the LINK 2. There are other adaptors available (ICD ADSCSI, LINK 1,
TRANSLATOR etc.), but they only work with SCSI drives that can have
parity disabled. Not all scsi's are the same, you would have to see a
tech if you dont use the LINK 2. As you are in the states, the only
place I know by name is TOAD, other people on this area could supply
you with their address to obtain the LINK 2, otherwise you can get
it from any of the shops in the U.K., dont ask me about Australia,
cos ATARI cleared out of here last year.

: 2. Is there a program which will allow either a Mac or PC (I have both) to
: write to an Atari format?

As far as the PC is concerned, the Atari formatting is almost identical
and so you should be able to read a PC formatted disk easily. With the
Mac, that is a completely different ballgame. The Mac formats a completely
different way to anything else, you would have to use the Apple File
Exchange and format to PC.

: 3. Where can a replacement mouse be found (mine works, but turns a bit roughly).

Any Atari dealer.

>logical sectoring 'cuz the icd book says that it won't run a lot of programs.
>So I thought that maybe tos 2.x and above would help.

WIth TOS < 1.04 the maximum partitions size is 256 MByte, with TOS < 4.0 the
maximum is 512 MByte, with TOS 4.0 or with the MagiC operating system it is
1 GByte maximum.
Partitions > 32 MByte have been possible since AHDI 3.0, i. e. since 1989
and they are documented in the AHDI 3.00 release notes. Software that can't
cope with such big partitions should be thrown into the trashcan because
this means that the author didn't read any guidelines or release notes for
over 5 years.

> Unfortunately, when I run at 9,600 baud I lose a lot of characters.

John,

You MUST use a serial patch, and you need to have RTS/CTS locked on (Flash doesn't have support for hardware handshaking otherwise). Serial Fix 2.0 is what I recommend.

1198. NVDI (worth it?)

Newsgroup: comp.sys.atari.st
Date: 1995-01-26 15:21:17 UTC
From: jpb3@ukc.ac.uk
Message-ID: <10716@falcon.ukc.ac.uk>
Source record: 172638

I have a little query that I hope some people can possibly give options on.
I have a 1040STE with 2 MB, and bog-standard TOS 1.62. I also have a little 52
MB hard drive, and have been wondering whether to buy NVDI 3.0 or not.

I've starting thinking about buying it at least partially because of it's
ability to use TrueType fonts, Speedo fonts etc. The only problem is that here
in rainy England NVDI costs 50 quids, that's about 80 dollars for you Americans
out there.

Do you think NVDI will create a speed increase to justify the quite high
cost of the software, and/or are the font capabilities of v3.0 usable in many
applications?

While I'm here I have another question...

Does anyone know if the Ladbroke DataPulse Plus hard drive has space for
2 devices, and if it does, how hard the second drive is to fit? My tiny 52 MB
drive is so frustrating at the moment, permanently full :-(

Well, thanks for any advice that anyone may give...

> Since some kind soul has told me now that I need the mintnp programm in order
> to run MiNT on my 1040 STe/1MB RAM, 60MB HD/

The "kind soul" that told you this was wrong. On your setup it doesn`t make any difference what you have.

> I now have another, burning question: WHERE CAN I FIND THIS PRG???

In your AUTO-folder! ;-)

MINTNP.PRG is just MINT.PRG but with a different filename. When MiNT starts it will check its own filename and enable or disable memory protection depending the name. This, however, is only true for MMU-equipped systems (f.e. PAK/3, TT and Falcon). On systems without a MMU the filename has no effect and memory protection will always be disabled.

MINTNP (as in "MiNT No Protection") will disable memory protection on MMU-equipped systems making some "ugly" programs that violate memory they don`t own run better (f.e. GEM/AES).

Hope this helps!

Comms software in the atari/Telecomm dir of atari.archive.umich.edu:
(Merit From the gopher I use.)

And before you (not you John) start (you know who I mean,) this list is by no
means exhaustive, nor is it in order of preference; so don't get
your panties in an uproar! :)

connect_2.46 : Well supported, considered to be top end. english & german
versions.
fzt_d220 : No longer supported but an excellent proggy anyway.
rufus106 : Don't know much about it, but have seen it mentioned.
storm100 : With patches to 1.02. Also a good one.
tterm210 : Don't know much about this one either
uniterm : Undisputed veteran of the comm proggy wars.
Others may be faster or have more features, but
this one still keeps plugging away.
vantrm38 : Don't know much about this one either

Your own Flash has gone through some upgrades and is now at v2.??
Another commercial proggy is called Stalker. I'm sure you'll be
getting MUCH more info on these & others shortly.

To move data reliably at higher speeds (9600+), you'll need a serial
patch to fix some problems with the serial port on the ST. serfx20
or hsmoda04 (considered to be the better of two) are reccommended.

All of this stuff (except the commercial proggies) can be picked
up from HENSA as well.

An ST, even the grizzled old almost-teenager that you have, should be
able to push 19,200bps (baud?) reliably with one of the serial patches
installed and without a hardware upgrade. More then fast enough to keep
a 14k4 modem hopping. With a h/w upgrade you could go to 57k (this is
right, isn't it??)

This should get you started, have fun!!

>1040st with tos 1.4 and a 105mg hd. I would like to run both but I
>don't want to try logical sectoring 'cuz the icd book says that it won't
>run a lot of programs. So I thought that maybe tos 2.x and above would
>help.

Any TOS can handle partitions with sector sizes up to 8192 bytes, which gives you 256 MB per partition (512 from TOS 1.04 onward with special formatting/partitioning software). GEMDOS 0.30 (Falcon030) and Mag!C 3 can handle 16384 bytes-per-sector partitions and thus 1 GB per partition.

In a table:

part. size MB Sector size (bytes) no. of clusters
TOS 1.00-1.02 256 8192 32K
TOS 1.04-3.06 512 8192 32K standard, 64K w/ 3rd
party formatter
TOS 4.00-4.04 1024 16384 64K

Bigger logical sectors are the only way to get large partitions, and any software should be able to handle them. Atari's AHDI 3.00 specification documented this back in 1988, so don't bother about what your (pretty old?) ICD booklet says. Mentioning this, this booklet also states that booting off a large partition ("BGM partition") is impossible, which is also not true.

bye, Peter

1205. Re: MiNTnet/MiNTos XWindow etc. Queries

From: mnb20@cam.ac.uk
Message-ID: <mnb20.21.00124441@cam.ac.uk>
Source record: 172650

In article <3g48oa$93o@status> mbecroft@iconz.co.nz (Mario Becroft) writes:

>First, I have no idea what MiNTnet, MiNTos are. What are they, and what
>can they be used for?

MiNTnet is a socket library and drivers to allow TCP/IP networking, including
internet access.

MiNTOS is a login suite for MiNT, allowing you to set up a multiuser system.
The documentation for MiNTnet says that it needs MiNTOS, although I think only
some parts such as the telnet and ftp daemons(sp?) do.

>I know minix lets you have long filenames. What else does it do?

You mean minixfs. Minix is a unix clone which I don't think is still
supported, minixfs just uses it's filesystem under MiNT. As well as the long
filenames it allows better security - only really useful on a multiuser system
- and symbolic links.

>Do I need MiNTnet/MiNTos to run minixfs?

No.

> Will my existing software still run under MiNT 1.12/Minix/MiNTos/MiNTnet?

Most of it will. I was surprised how good compatibility was,

>If I have MiNTnet/MiNTos/Minix/X Window, will I still be using the
>GEM.SYS from MultiTOS?

You can't have X11R5 and gem at once, although you can have them both on the
hard disc and run one or the other as you want.

> Will I still be able to Multitask while running these things?

Yes.

>I guess MiNTnet does networking. Does this set up a logical drive and
>have all other computers listed as subdirectories? Or does it work in a
>toally different way?

All MiNTnet does is provides a socket library allowing programs on different
computers to send data streams in a fast reliable and portable way. One use of
this is with the nfs filesystem which allows you to mount remote drives. You
have to type - or put in a startup file - something like
mount othercomputer:/gnu/source/myprog /nfs/prog
to mount the /gnu/source/myprog file from the computer called othercomputer
and it will then be available to you as /nfs/prog

>get max 8 characters in the filename.

>Am I using a bad version of ls or have I created the minix disk wrong?

Does ls list the full filenames on the hard discs? The version in the MiNT distribution kit doesn't seem to be a MiNT domain program. If it's OK on the hard discs then I think you must have created the floppy wrong, I've never had much success.

>I also need to know which shell is best to use for mint and which toolkit to
>grab hold of.

I like tcsh, but there are MiNT aware versions of all the unix shells.

From: mfogarty@netcom.com
Message-ID: <mfogartyD315C7.Err@netcom.com>
Source record: 172552
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

My Friend is setting up a multichannel sampling system (Digital FX) on
his 1040STf. This system requires a min. 20msec access SCSI drive
(for direct recording of sound). I found and purchased an ICD Link2.*
While trying to make it work with two different (known working) SCSI
drives I seem to have killed it.

Now, even with the Link2 disconnected, on a totally minimal system,
the CPU powers up showing a variable number of bombs (~2-12) or
shows no bombs at all and just hangs.

During the several times that I was able to boot (before the above-
mentioned total failure) I used ICD's software to scan the SCSI bus
and never saw the drives. I tried scanning for the drives both
with drive parity enabled and disabled.

Please help! Either by direct mail or followups here.
1. Is the system recoverable?
2. What is the problem with the Link2?

Thanks,
Mike Fogarty

NVDI3 eats up *LOADS* of memory, unless you really need scalable fonts, it is better off the computer, until you need it to print something. However , you DO need a screen accelerator - so why not buy NVDI 2.5 from System Solutions (I think it is about 30 pounds), if you find you do need v3 then you can upgrade (although it will be about 10 pounds more inc. p&p)

I'm afraid what we want is improved quality not more pages, the reason I
stopped buying STF was basically too many technical inaccuracies.

Bottom line: quality not quantity.

I agree I am also a Spectre User. I have a few questions myself!!!

FAQ means Frequently ASKED Questions

Anyway I am up for it. I have lots to ask though and little to put in
but I will do my best to contribute.

There is a program on a.a.u.e called 1stw2ps.arc in the printing directory.
This is a GEM based program that will allow you to control things such as font size etc. It will even handle any .IMG files you have in your document.

I don't just blame 2B. (They just do what every others are doing). I blame
everybody.

>I don't really see that MSTE or TT had a specific software support
>problem. Some features were never really used (like the LAN connection),
>but apart from that, virtually any application software runs on those
>machines.

No, because they lived their lives on old software. But not much has been
updated to support the exstra features which the machines have, (well not
that much for the MSTE, mostly for the TT).

>Atari lost at least four years, and they made a lot of wrong decisions.

>
>(That's another mystery to me: In the times of the ST's big success,
>Atari must have made gazillions of profit - where did it go?)

I agree Atari did alot of things wrong. But while Atari screwed around
their business the developers did too. (They probably blamed Atari for
this, and this is where i do not agree).

>Oh yes, it does. By the time the Falcon was released, most of the
>developers were so disappointed by Atari that they already had
>found alternatives for themselves, and that's why the Falcon
>did not receive the attention it may have deserved. Personally,

>jobs). The Falcon's momentum, however, was not enough to bring
>up a new generation of developers (and users!) - the Falcon simply

>was late and slow.

The Falcon is in some way late, and ofcouse it's slow as well. But then
we're back to my main point again. Why is the Falcon slow ? because you
tell it to run old software which hasn't been updated to suit the hardware.
To get back to 2B, they claim they got a total new operating system for
the ST and Falcon, which is increasing the way of handling software.
So why do they delay such a program in advance of NVDI3.0
A new optimized OS must be something everybody is interested in, but they
claim NVDI is needed more, (or at least they claim they can sell more NVDI
than the OS). This is something i do not understand about 2B at all. And
is infact the only complaint i've given about 2B.

The Atari is easily upgraded to a faster machine. Ofcouse it takes exstra
money as well, (Thats just normal). But where is the idea of upgrading
an Falcon to, for an example, a 68040, if we keep on having this old software.
So now we have the right speed, (which infact will compete with an 486DX66
just fine), but no software. How do you think this will increase the sales
on upgrades ? To be honest, i think it will decrease the sales. And so does
the developers of the upgrades. They count on a low sale, and then the price
is going high, which will lower the sales even more.
So you see, it's a bad circle, which is caused by many things, but the bottom
line is the software, just like the PC platform.

>I agree that "standard" software is the driving factor for PC sales.
>OTOH, even if you had loads of cool software for the Falcon,
>I doubt you could sell a 16 MHz machine with an awful integrated
>keyboard, quality problems in the audio and DMA hardware,
>and an unstable and slow OS. Well, maybe you can, but this
>is an academic question since the time window of opportunity is
>long gone.

That why you now have possibilities of making an upgrade, as mentioned
above.

>
>Face it: There will be no new users, and the market is collapsing.
>No one can be blamed for leaving the market, and we should be
>happy that some fellows are still around. They are few, however,
>and they cannot do all the things we want or need for our machines.
>

I am facing it, and i do not like it, cause it is the end user who is
paying for this, alone!

> Thanx you very much!!!

A friend of mine has a interface that connects to the hard disk
and makes it a SCSI compatible disk. After that he connected a
SCSI to DMA interface (the one from ICD) and that was it!

Of course all that overhead slows down the accesses so i suggest
that you take a SCSI hard disk. It is cheaper that take all this
trouble.

> One of the mag componies sell a 28 Mhz accelerator for 200 Ukp but
> thats a bit expensive when a 12.5 mhz 68k only costs 7.29 ukp.

The reason for this is that putting a 12.5Mhz 68K in your ST will result
in *no* improvement, whislt a T28 will be 2-3 times faster.

A CPU only runs as fast as the system clock pushes it. You could up the
STs system clock to 12.5Mhz, but most of the rest of the motherboard would
have good reason to complain. Its designed for 8Mhz. Alternatively seperate
the CPU from the rest of the machine and run each at a different speed.
You then need to resync them for memory access. A cache helps here as well.

Basically by the time you've done all of this - you might as well have paid
out for a T28. It will be *much* faster - and it will work.

Roland.

This needs a BIG correction, FLASH 1.2 was upgraded to 1.61, then
Alan Page brought out a later program called the STORM..

FLASH II is nothing to do with Alan Pages Flash 1.61 at all,
in fact Alan rubished it...

The FLASH Name was brought by a OZZY firm....

>
> Adrian (apb25@cam.ac.uk)

I think the printer drivers in NVDI 3 are better than those in 2.5, but that, of course, depends on what driver you need.

You can, of course, not install any scalable fonts (or delete them when installed) to save hard disk space. Or keep them on the hard disk but hide them from NVDI 3 (various ways to do this) so they don't take up computer memory unless needed.

Upgrade cost from 2.5 to 3 is around £20, not just £10.

If you really want scalable fonts, get NVDI 3. If you are in need of a good printer driver (to replace a GDOS driver) check out the two. I'm inclined to think the improved drivers make 3 worth the extra cost, but it is a matter of personal preference and spare money. But do get one or the other; they make a significant difference. I don't think 3 has enough speed advantage over 2.5 to be worth preferring for that reason.

> : Leslie

There are various ways of hiding fonts from NVDI 3. If you already have
NVDI 2.5 and Speedo there may not be much point in upgrading, though I
think the printer drivers in NVDI 3 are better than in 2.5 or Speedo.

partitions under ICD PRO Utilities. One was Knife ST because it didn't
understand the drive's bootsector. (Program runs fine; it just doesn't like
the hard drive's sectoring scheme) The other was Audio Sculpture,
presumably for the same reasons. Otherwise, absolutely nothing has given me
a problem. I'd say go for BGM partitions... the only difference between
them and GEM partitions is that they use larger clusters.

LDW power isn't too bad, the interface is a bit naff; it's only a ten or
fifteen quid though (I got it in Debenhams in Guildford) so it may be
worth a look.

> Are there any good PD programs? Opus is was good, shame it is so
> fussy and I doubt wether it would like NVDI:3's GDOS!

It might do, it works fine with Speedo (you have to turn off the character
spacing option, as the .wid file written by fontwid is junk). The problem
with Opus is that it doesn't like large screens; if you're prepared to run
in ST high it's fine, I've used it on a falcon a lot.

I never did like sheet much, but apparently it works on the Falcon. You
can get it to draw charts if you use macros, and I think the registered
version (is it still supported. I doubt it) gives you an easier way
similar to that in Opus.

> memory unless needed.

I think the memory used by NVDI is not affected much by the number of
fonts, it only stores a small amount of information about each when they
aren't needed. What takes memory is the cache which you can reduce
drastically, slowing vector font performance.

NVDI 2.5 + Speedo 5 uses rather more memory than NVDI 3 so if you want
scalable fonts NVDI 3 is definitely the way to go.

> If you really want scalable fonts, get NVDI 3. If you are in need of a good

There was some talk of it being slower at some operations. The only reason
I can think of for getting it is the scalable fonts, but that is a very
important reason if you have or are thinking of getting a program that can
really make use of them such as Papyrus.

Not that I know of for the atari.

The tos.img files are just a binary file without a header or anything. The software that came with your prom blower almost certainly includes an option to convert from a binary file to intel-hex. You will probably also need to split the file into odd and even bytes to make a two rom set (I think it's odd and even bytes, and not just two halves, but I'm not sure, anyone know?) and you should also have a program to do that supplied with your prommer.

Hi,

I managed to MiNT and term running nicely. My only problem is that the windows in TOSWin only do VT52, and lynx, pine, etc don't run in VT52. So the question is: Is there any way I can have these TOSWin windows do vT100? Myabe a proggie which I run which then in turn calls trsh (termshell) or something? Myabe something completely different? (But not X, I don't feel like installing that (yet).) advTHANKSance

I didn't look it up for you - but I believe the reason both drives are on in the older Atari's is because there was only one power on line that is sent to both drives. (guess itshould be called a power up or a spin up line. - you get the idea.) Wayne

In theory, yes.

But unfortunately, *ACSI* cannot handle more than 1GB. If the drivers would do
some tricks, it'd work. ATM the drivers don't do that.

SCSI on Falcon or TT can handle more than 1GB, of course.

Cubase Audio allows you to assign samples to individual MIDI notes. This
is included into an extremely comprehensive MIDI/Audio package - arguably
the best micro based music package - and the price matches!

I know of exactly the program you want. Shouldn't be too long, from what
I hear. Can't say any more at present.

Hassle me about it in a couple of weeks if you're interested.

Dear Ellis,

I can only say that development is progressing, supported by a reputable
atari development house. I'm otherwise sworn to secrecy. Early in the New
Year I believe.

In the meantime, I use Cubase Audio, which provides basic MIDI control of
samples, as long as they fit into main memory, and no opitch shift is
provided. For HD recording, and MIDI/Audio sequencing it's probably hard
to beat - pricy though.

The most important thing I've discovered using the Falcon is that the
internal CODEC (ADC/DAC) and the audio i/o are not what they could be.
The solution is 2 boxes - the S/DIF Interface (Digital i/o - DAT etc.)
and the FA8, providing 8 line level analogue outputs. This means I can
use a DAT for the actual digitising as well as as a back-up for my
harddrive. The 8 outputs are a dream, whatever audio software you intend
to run.

Hope that's helpful,

Tony

Sorry I didn't reply sooner, a bit tied up 1 way or another. :-)

I was playing with the said system recently. I expect a commercial
release pretty soon. I must say it's pretty exciting. The DSP code which
controls the pitch of the samples etc. is extremely well done, it
certainly takes on most General Midi players I've used. I didn't get a
chance to test any other sample manipulation, (tremelo, chorus etc.), but
I'd still use it in preference to a JV-30 for most applications.

You can use your own samples, but I know the programmer wants to supply
the system with high quality sounds - perhaps not that important in my
view.

With any luck it may be able to be controlled in the background by the
MIDI output data, which would mean it would run with any sequencer
program, but that's not for sure yet.

Hassle System Solutions for more info., but don't expect to be able to
get hold of a copy before January.

Yours

Tony.

Hello Ellis,

The Falcon would have the stability modification done but not the bass
boost or the line input level, these two mods are #59.95

I don't know about the The Digital Sound Module/MidiPlayer programme,
haven't heard anything about us realesing it.

The FDI is #239 inc vat.

ATB, G. CAMPO
ssolutions@cix.compulink.co.uk

Numerous other references have been made to TDSM; whether this is
equivalent to MidiPlayer Falcon I do not know.

What I do not believe is that System Solutions are releasing TDSM and they
don't know about. Either they aren't and they don't or they will and they
do. I have seen previews in Sound on Sound and the late ST Review.

What is the truth?

Also, why was I not asked whether I wanted audio modifications on my computer when I bought it (I would have)?

1249. New Atari Community E-mail List

Newsgroup: comp.sys.atari.st
Date: 1995-01-28 16:57:45 UTC

Message-ID: <JM45KfR.sirsmedley@delphi.com>
Source record: 172596

The Atari Community E-mail Address Book
Revised 21-Jan-95

Hello all! This list has been compiled to provide Atarians worldwide with the addresses to contact other members of our ever-changing Atari community. The first half of this list is user groups. For those groups with multiple e-mail addresses, the first is usually the primary contact. The second half of this list is significant members of the Atari community.

Using this list -
I created this list to encourage communication between Atarians everywhere. If you have a question without an answer, or are moving soon and need to find a new user group, this list should help. It is also a great way to distribute Atari related press releases, such as upcoming Atari shows and new product announcements. And I would LOVE to see user groups sharing newsletter articles via these addresses! However, it SHOULD NOT be used as an advertising tool. If you are a retailer looking to advertise, please contact the individuals on the list and ask if they want to receive your mailings. Some people must pay for their e-mail by the character and would not want unsolicited commercial mailings.

If you have any changes, additions, or suggestions, please contact me via private e-mail. My addresses are listed under AUNT.

Dan Mazurowski, AKA Sir Smedley
Semi-official e-mail contact for AUNT

PS - This list may be printed and distributed at will, though I would like credit for compiling it. Please be sure to contact me for the latest update, as I won't post every minor change.

PPS - Any Atari gurus want to volunteer their addresses for the list? Not everybody has access to Usenet, ya know!

I need contact address of software house RENEGADE(Bitmap bros;
their address, what games they made for atari because they are the
best in use of Atari's graphical & sound capabilities.).

Talking of games there are a few more companies that made interesting
games which I would like to get my hand on. Of course, I need their
contact addresses too!!!
First there is SENSIBLE SOFTWARE, then LANGKHOR and MICROPROSE.

LOOKING FORWARD FOR YOUR ANSWERS , GUYS!!!!!!!!!!!!!!!!

LONG LIVE ATARI ! ! !

That's not all.

There is one midi program I bought from pirat and it failed.

Program is called AURA made by C-LAB. So I anyone knows their address
I would appriciate it.
:-)))
Thanks again. BYE!!!

I would apriciated

1251. For Sale!

Message-ID: <3ge30h$9sb@hippo.shef.ac.uk>
Source record: 172598

I am thinking of selling my Atari. This is not an easy decision but
my decision to drive into, or rather skid past, a wall in Wales
rather dictates my course of action! I'll be sorry to see it go.
Especially when all it is replaced by is a new wing, a splash of
paint, a new bumper... etc.. etc...

Anyway, here's what I have:

THE COMPUTER
Atari Mega STe
16mhz Processor
Blitter Chip
Separate Keyboard (PC style - sorry, rude word I know)
4mb Ram
50mb internal hard disk drive
High density (1.44mb) internal floppy drive
Internal TV modulator

ACCESSORIES
Atari SM124 Hi-Res Grey-scale mono monitor
Naksha Mouse
Power Computing PC720b external double density drive
(with Anti-virus and Blitz-Turbo copying facility)
STe -> Scart lead

SOFTWARE

Pagestream v.2.2 Excellent (I think) desktop publisher + extra fonts
First Word Plus

Proflight
Flight Sim II
Secret of Monkey Island

+ other games and loads of PD utils

[BUYER COLLECTS/Organises delivery - though I may be able to deliver in
the Sheffield and sometimes London area)

It's an excellent 'serious' enthusiast's set-up, for a small business
and similar.

Please make me an offer, and I'll decide whether the car's repairs are
that necessary!

Cheers, and Happy Atari-ing,

Matt Stroh.

1252. Re: Spreadsheets

>fussy and I doubt wether it would like NVDI:3's GDOS!
>

I don't know about P.D. stuff, but I believe that LDW Power works under MultiTOS. There is a demo of version 1 on ftp.cnam.fr called "POWDEMO.LZH" (I think it's an lzh...) Try that out. Version 2 is fairly widely available, and version 3 is just about to be released! I'm sure that version 3 will work on a Falcon with MTOS and NVDI 3, and I know that version 2 will run on a Falcon, but I don't know about its compatibility with MTOS or NVDI 3. In any case, I don't know what the price will be, but I know that it is a killer good package. Among other things, it offers Lotus 123 file and command compatibility, and Lotus 123 isn't such a bad package. When it's released, Power 3 _will_ be the best Atari spreadsheet.
Incidentally, I use the spreadsheet in Atari Works, and I find that it does pretty much what I need it to do. It works perfectly under MultiTOS, and usually works quite well with Speedo GDOS 5 (and presumably NVDI 3). It isn't exactly a superpowerful analytical tool, but it does have its points. If your needs aren't too sophisticated, it could be the thing. It's graphing capabilities are limited to a maximum of 30 data points, and it only supports four different types of graphs (pie, bar, line, and stacked bar). It has the usual set of financial, statistical, and logical functions, and would be a good choice for any typical home user. Plus you get a fairly good Word Processor and a really easy to use non-relational database thrown in for free.
I also use a (registered) shareware program - B/STAT for more advanced statistical stuff, and it's a tremendous program. Unfortunately it doesn't work under MTOS, and since it's currently written and developed in GFA Basic, I'm not really expecting it to. (No offence to GFA or GFA programmers intended but you really have to know work-arounds to get GFA to be compatible with MTOS, and B/STAT is a MASSIVE piece of code!) I'm studying third year statistical methods in economics and econometrics, and B/STAT beats the heck out of all* of the stats packages that I've seen recomended by my profs. It must have hundreds of stats features, and *tons* of graphing options, and it is extremely easy to use. I recomend that you check it out, the latest version even does absolutely gorgeous 256 colour gradient fills on the graphs! You can find it on most of the main ftp sites. Even if you don't need heavy statistical analysis, you may find the graphing functions quite attractive.

Not out of disrespect for you Cornelius, but I must question the validity of your assumptions. I have a diploma in marketing, and I am working towards a Management degree with majors in economics and marketing, and a minor in computer science, and I have taken one course each in inductive and deductive logic. I also have a strong hobby in studying biological life cycles for individuals and species, as I am very interested in the crossovers between biological and corporate entities. Based on everything that I've studied, I think that prediting the extinction of the TOS platform is not generally a very enlightened view. No prediction of the future can be 100%, but my own opinion is that there is a far better chance of the TOS platform continuing to be not only viable but desirable, than there is of Windows 4 (a.k.a. "Chicago" a.k.a. "Win95") actually coming out in 1995. And even that seems to be a fairly good chance. Don't base your opinion of the entire TOS platform solely on your opinion of Atari's future in computers.

From: tdcflcn@infinet.com
Message-ID: <3gegif$ma5@horus.infinet.com>
Source record: 172456

I have been trying to get Minix working so I can get MintNet and
maybe X11 running.

BUT, every time I use us 'FSCK' on the partition I changed with
'minit' I get 'Not a Minix Partition...'. I have MINTNP 1.12
in the auto folder and minix.xfs in the root.

I but mint 1.04 back in the auto folder and 'FSCK' works fine.

Any ideas? Do I need to do something different with 1.12

Thanks for any help.

>
> Where will I find Mfsfm? Does it compare with Selectric for features?

It's on aaue somewhere, can't remember exactly but I'd guess at the Mint
directory.

As for features, it has the most important ones but it isn't as nice to
use. It's the best one to use for MiNT, as it always forces you to use
drive u: so you can then ignore the drive altogether and use filenames
like /hd/file.txt

> I guess I won't be able to run GEM programs from a command line either then?

Not normally, although I think the one built into gemini will (not sure
about this)

> I have Geminidesk 1.999e. From what you said, I think this runs in MiNT
> domain, and therefor would support minixfs long filenames? It does seem
> to read the U: drive in a different way (lowercase, no .. entry.)

Why there isn't a .. entry I don't know; it reads drive u: from the MiNT
domain where all filenames are lower case, unless they were created by a
MiNT domain program in which case they're whatever the user specified,
normally lower case.

> BTW, do you know what the `FD' directory entry in my u:\dev\ directory is?

It lets you access all the open file handles as though they were files.
There's not much use for it I can think of, apart from the stdin and
stdout ones which you can also access as /dev/stdin and /dev/stdout

1264. Upgrading Notator

Newsgroup: comp.sys.atari.st
Date: 1995-01-28 23:46:06 UTC
From: bjr2@Ra.MsState.Edu
Message-ID: <3gekvu$s4t@NNTP.MsState.Edu>
Source record: 172460

Aloha,
I'm wondering what steps I need to take to possibly upgrade
Notator 3.01 to a later version. Is it even necessiary?
See...I purchased my copy of Notator and the dongle in a bulk
auction deal. Didn't really realize what I had until I started playing
around with it. Problem is...I've only got about half of the documentation
it seems. Enough to make the program extremely useful...but no details on
upgrading...who what when where and why. Am I correct in assumeing that as
long as I have the original hardware dongle that I am entitled to upgrades
and service, or do I have to reregister the entire liscense with Clabs at
full retail price?
Are there any versions after 3.01? If so..what are some of the
bug fixes (I've yet to find any bugs other than some trouble accessing
floppys...more on that later), added features?
The only thing about 3.01 that really annoys me...and it could
very well be my version of tos or something, is that the only floppy it will
read from is the one that was in it at boot-up. If I boot the Atari cold...
with no floppy in the drive...it will read and write to any floppy I stick
in the drive...labled A or B. When I boot the computer with a floppy in the
drive...Notator will read and write to that floppy...but if I change disks...
then try to access...it hangs the entire system! This even happens if I try
to access the drive as device B rather than A. This glitch doesn't apply
to other SoftLink Partitions...the desk top can still look at any floppy I
choose to put in...and so can the other programs I run in other softlink
partitions. Only notator seems to have this problem...run alone or in
softlink.
It's all really strage...
The problem persists even when I'm connected to my Hard Drive and boot from
it. It will only read the particular floppy that was in the system at boot
time....however....it will look at any hard drive partition with no problems
what so ever. This is really annoying since I might like to use the
system in live situations without a hardrive and monitor. The problem
forbids me from say setting up a boot disk that automaticly sets up
Notator with an array of macros set in so I could run a live performance
by simply inserting disks and punching predefined key sequences.

These are the things I've attempted to solve the problem on a 4 meg 1040STe
Stock with TOS 1.62. Only one of them worked.

1) Boot the system with no floppy in the drive at all...then load either
softlink or Notator manualy. This works...but I still can't format a
floppy with the format function in Notator. (No big deal...I can format
with some other compatible accessory if I really need that function, or
key over to another SoftLink partition and format).

2) Remove all auto programs such as Warp9. This didn't fix the problem.
I still use Warp9 with Notator according to specific instructions that
came with Warp9 concerning Notator.

3) Disconnecting all external devices such as printers, hard drives, scsi cards,
Modems, midi devices...etc. This still didn't fix the problem. Notator
will only look at the disk that was in at boot up. Even if SoftLink or
Notator is not loaded automaticly.

4) Loading Notator with no/various other, AUTOLOAD.SON files.
This didn't work either. I had found that sometimes the AUTOLOAD.SON file
could get corrupted and cause problems...easily fixed by deleting it and
building another Auto song...or booting with no autoload.son at all.

5) Running Notator without SoftLink. This didn't work either...
The problem persists wether SoftLink is present or not. It persists
wether either program is loaded manualy or automaticly at boot.

It seems like Notator is taking a picture of what ever floppy was in the
drive at boot up from TOS or something...and not allowing that buffer to
change with a media change.

Might this be an isolated bug with only my particular machine/program?
Any one else experienced it?
How/Who do I see to possibly upgrade to a later version?

Thanks,
Brian

Absolutely. If you just need the speed get NVDI 2.5. If however, you also
need Speedo and TrueType fonts and if you can spare some 100-200 KB of RAM
get NVDI 3. I haven't seen anybody who regretted to have bought NVDI. Some
people won't even touch an Atari running without it ;-)

I have an Atari Megat ST system for sale. The Mega ST has 2mb of Ram. Other items include an Atari SM124 monitor, an Indus GTS-100 floppy drive, a Supra 20mb hard drive, and Spectre GCR. The Mega ST has also has an internal floppy, and comes with very nice keyboard.

I will accept any reasonable offer for this system. Contact me at Sanking@hubcap.clemson.edu.

>is what I recommend.

No need for all of that, get the patch program for Flash 1.xx, its on the net,
I think it was included with HS this is part of the file name..

If you like I will archive the part that I have and send it to Danny
of Hensa Fame....

The best program TSR to remove bugs in the OS is HSMODA04, there is no other
TSR or program to touch it....

>viced? Any advice will be appreciated.

You Can't suff up a drive by removing a disk when its running, you could stuff
up the data if it was writing to the disk...

I have seen a lot of damaged head from using damaged disk, and that can't be
repaired, but some drives, do have problems with a latch and spring, as you are
removing the disk, the mech drops down, never ever try to pull the disk out
when this happends, what you do is to push the disk back in, then eject it
again..

This is caused by a Latch not holding the mech up, with a file/knife
it is easy to fix, in fact I have seen info mentioned from Atari regarding
this problem...

I think I have some of those drives here, may be I can post this info
to the net, but will have to be a .IMG file....

thanks for your effort Mark.

I would just like to put this up for any who might know. I want to know how to print to my APPLE LASERWRITER II through my Atari 1040STe using SPECTRE GCR. I am running system 6.0.8 and I have no troubles running a ton of DTP software.... but I cannont output anything@!!!!

I know it can been done. I know Dave Small gave suggestions on programs to use that will allow you to do just this. But I can't contact Dave Small anymore and I need help with this one!!!

Thanks..

James Schofield

1273. FLASH PATCH...

Newsgroup: comp.sys.atari.st
Date: 1995-01-29 02:50:14 UTC
From: sheppard_r@kosmos.wcc.govt.nz
Message-ID: <3gevp6$9ql@golem.wcc.govt.nz>
Source record: 172467

Here is the readme from Flash Patch, I think there is another
version, but I have never found it, lets you use the Midi port etc...

~~~~~~
Flash Patch (wr) 26.08.1990 by The Frontier

Some of You, who use highspeed or error-correcting modem, will have noticed,
that Flash has big problems with X/Y-Modem upload when you have connected
with a higher speed than 2400/NONE. Such uploads are interrupted by a mass
of errors.

Simple problem. Flash, in opposition to the manual, doesn't use RTS/CTS.
When started, it deactivates your own setting by simply calling Rsconf
without the appropriate setting. So you have problems when uploading with
blocksizes higher 128 Bytes (MNP-modems with 2400 bps normally have a 256
byte nuffer for input). When downloading with Flash, you should have no
problems, because the code is fast enough to store the data between two
blocks without a timeout. Only at 19200 baud it can occure, that you
might have errors. If Flash would use RTS/CTS protocoll, this could work
too.

For the solution of this I have written FLASHPAT, which patches the main-
program FLASH.PRG so that it correctly activates RTS/CTS. After starting
FLASHPAT from the Desktop, you have to choose 'FLASH.PRG' in the fileselector
and then the choice between patching Flash for RTS/CTS or patching it back
to the original code, so that you don't have to have Flash on your disk
two times, but can swith between the settings by simply use of FLASHPAT.

****
* Note, that you must not have FLASH packed using something like *
* PFXPAK or DC_SQUISH, otherwhise Flash will not be patched *
****

FLASHPAT precautionary tests the program choosen for really being
FLASH. If not, you will get an error message.

Have fun with your stressfree uploads.......The Frontier

~~~~~~

You still need the TOS fix as most of Atari OS are buged, TOS 1.4 does not
have support for RTS/CTS flow control, but does if you use one of
those Fix programs like HSMODA04....

I assume you're talking about AHDI 6.06. Version 6.06 did have
to timeout, but 6.061 fixes that and a few other problems with 6.06.
It has little to do with the conversation, but I thought it might
help. As for the previous problem, installing AHDI once again might
solve the problem.

BTW, with MagiC 3.0 the maximum partition number will be 23 (C-Z, not U).
These additional partitions can be accessed like any other partition. You
need an appropriate hard disk driver, of course. AHDI, ICD and most others
won't allow more than 14 partitions for TOS use.

C.J.Ridd@cs.bham.ac.uk (Chris Ridd) writes:

>Uwe, what new features are in HDDRIVER 4? Does it work well with MagiC
>3?

It does, indeed. One of the major new features is available with MagiC 3
only. With MagiC 3 and HDDRIVER 4 you get non-blocking data transfer with
ACSI and SCSI, i. e. multitasking continues while data are transferred via
DMA. This speeds up the system a lot when there is a lot hard disk activity.
Only the program that initiated the hard disk transfer will have to wait,
all other programs won't be stopped but continue to run without noticing
that there is hard disk activity.
The other major new feature is a new GUI. There is a single program now,
called HDDRUTIL, which installs the driver, configures it, set bus
arbitration and so on. You don't have several small programs for each task
like it was befor.
The new driver will be available by the end of this week, at least here in
Germany.

Huh?

Why do you believe the TT is a failure software-wise? It was THE machine for
DTP using Calamus and DA's stuff.

Get your facts straight. It might have been this way in Denmark, with folks
only playing games, but it wasn't this way down here.

The Falcon now has great software support. Look at all the professional midi
and D2D-stuff. That's great.

1287. Help needed with nos042.tos

Newsgroup: comp.sys.atari.st
Date: 1995-01-29 17:47:05 UTC
From: pking@random.ucs.mun.ca
Message-ID: <3ggkap$amq@coranto.ucs.mun.ca>
Source record: 172481

Hi,
Ok, I managed to get NOS042.TOS and uncompress it. I have also
grabbed the nosdoc and nosfiles files.

Question: What do I do now? I am not fluent in network or
communications packages!! Do I have to have my own IP address? domain
name? hostname? Are there dummy addresses?

Unix end: My host is running Ultrix. What software do I need on
the Unix end to talk with NOS042? Where can it be found? I have a
friend who uses TIA (The Internet Adaptor) on his unix account which
talks to his IBM-cone client software (Mosaic, Trumpet Winsock). It uses
dummy addresses to make the connection. What is the Atari equivalent?

I would greatly appreciate any help (suggestions, pointers to
documents where these questions are answered, e-mail, etc) in the set-up
of NOS042.TOS and the Unix set-up!! ~8-^[(Me, with my last remaining
strand of hair after trying to set up this slip connection).

Thanks,
Peter

1288. Good STuff for sale

Newsgroup: comp.sys.atari.st
Date: 1995-01-29 18:02:23 UTC
From: xitqu@ucssun1.sdsu.edu
Message-ID: <3ggl7f$j0h@gondor.sdsu.edu>
Source record: 172482

Got a lot of good St hardware and software for sale. (Gotta recoup the
Falcon purchase!)

SLM605 (less than 1000 pages on new drum, comes w/
used but usable extra drum, Laserbrain, Diablo
630 emulator and Ultrascript) $400
Supra 24/96 Fax/Modem $ 40
Supra 2400 Modem $ 25

Calamus SL (November '93 update) $200
Pagestream 2.2 (with 47 fonts and Qwikforms) $100
Band in a Box $ 40
Diamond Edge 1.1 $ 35
Diamond Back 3 $ 35
Ishar Falcon $ 25
Cardfile 4 $ 20
Diamond Back 2 $ 10

If you don't like a price, or want to make a package deal,
I'm open to suggestions.

Prices include shipping to anywhere in the Continental U.S.
and maybe further. C.O.D. fee (if desired) paid by buyer.

Dan Phillips

Oh, all the prommers I've seen have included some way to use binary files. If yours doesnt' then I don't think I can help you. I have seen a couple of programs to convert to Motorola S-records for the Atari, but not one for Intel-hex, although there may be one. You could ask in a PC group.

Newsgroup: comp.sys.atari.st
Date: 1995-01-29 19:59:26 UTC
From: STIRRE31@MAINE.MAINE.EDU
Message-ID: <95029.145926STIRRE31@MAINE.MAINE.EDU>
Source record: 172488

I am starting to rethink how great I think NVDI 3 is :-)!
I have my Canon BJ-5 set up just as I did under Speedo GDOS for the
Canon BJ-10 driver. The difference is that Speedo worked! I have
messed around with NVDI's makeprn and still cannot get good results.
The control command is the same as in my manual but does not seem to
want to work. Since Speedo works fine I am prone to think that it is
NVDI's fault (along with my inability to confingure it correctly).
I also did set up for US letter in the CPX but still got the messege
about a messed up paper size. Selecting "select size to current printer"
in Atariworks does _not_ cause a US letter size! Why is this?
It is only after I mess around with margins in makeprn that I can get
US letter and then it still does not print correctly!!!! Arrrrgggghhhh!!!!

>more reliable sources than Silicon-Times Report.

Steve,

Excuse me?!?!!! It would be best if you used that rationale with regard to what you read in the UseNet, as well.

Nowhere in STReport has there been a report that GEnie (or any other service) is going bankrupt. There was a report a couple of weeks ago regarding the numbers of subscribers for every service, excluding one (I believe). That report stated that GEnie was at the bottom, and its numbers were getting lower while others were on an upward climb. I can post those figures for you, if you'd like.

Otherwise, please keep the unwarranted attacks out of it. I take great pride in the work that I do for the Atari section of STReport and there's been nothing in those pages, for the past year or so, to deserve those kinds of comments.

Both the cache and speed are (hardware) switch selectable, so you can run
it in the native 8 Mhz mode. I had no compatibilty problems at 8Mhz but
my Hawk scanner refused to work at 28Mhz.

This is not a standard of C, this is a standard of the arcitecture, the
thing you are talking about is a PC standard of reading extended keys.

> last year).

No. Very few Atari users have an Atari based CD-ROM unit.

What quite a few have is access to one on a PC or Mac, so putting Atari
software on one isn't quite as dumb as it may seem.

1308. Notator Question

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 03:27:02 UTC
From: hellman@teleport.com
Message-ID: <3ghma6$p4p@kelly.teleport.com>
Source record: 172501

Hello All,
I'm trying to produce a printed score from Notator by manually
inputting notes on screen. I can't get the pick-up notes right because
of the automatic timing requirements.
The piece I'm doing requires one beat of pick up notes before the
first full bar, and the other 3 beats (in 4/4) are in the last measure,
which is then followed by another section of the song (so I can't just do
a limitation in print-out).
I'm stuck with automatic rests I don't want in the pick-up and
last bars. Does anyone know a way around this?
Thanks in advance.

Source record: 172502

] NOW THE POINT: There was a little "Supradrive 30MB" there. It looked
] like a simple plug-in to the DMA port....no host adapter, no interface,
] etc.... Is this hard drive worth anything? DOES ANYBODY KNOW WHAT'S
] INSIDE IT, AND IF IT CAN BE UPGRADED????

If it's the one I think it is (reviewed by ST-Format a few years back),
then it's supposed to be a pretty good unit. Host adaptor is supposed to
be built into it. If it works (easy to check, download AHDI, stick it
onto a disk, plug in the drive, turn on the drive, wait for about 30secs
turn on the computer, run AHDI.PRG. If it works, C: should be available
and usable.

If no-one else gives better info, I'll try and find the review.
It's probably within 10feet of me, but finding it is another matter! :)

There are no dummy-adresses, so it's the best thing really to have an
own IP-adress.
>
> Unix end: My host is running Ultrix. What software do I need on

If you have your own IP-adress, the Unix-host shouldn't need any
special software, for NOS uses TCP/IP and I haven't heard of a
Unix-machine which doesn't support this (nowadays).
If, your friend is using TIA, there might in deed not be any
TCP/IP-support on your host. In this case, I think you can't work with
NOS. I know there is a package called term (a port from Unix), which
does about the same as TIA, but there are two problems (from your
point of view) with this:

1. The package has to run on the host, too.
2. It will only run under Mint + MintNet (on the Atari-side). (That's what I think, any
other opinions?)

Well, I can only tell you that I paid 80 quid for my 2.5 version and it was worth every penny of it! The speed increase is tremendous and having GDOS around anytime is really a great benefit. I'd say go for it, esp. if you're interested in the font capabilities but it's worth the money for the speed increase alone. IMHO.

What is with all of these "for sale" and "auction!" posts which are

all double spaced!?

I mean, is it something with Usenet that when it sees "for sale" in the

subject line, it has to double the height of the post? Or are all of

these posts from the same person? Or maybe it's a PC thing with the

useless LF characters.. Man, PC ASCII is OUT OF >DATE<!

1318. MagiC 3.0

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 09:12:23 UTC
From: richcsst@crash.cts.com
Message-ID: <D37o8o.BpH@crash.cts.com>
Source record: 172516

Listen folks I have version 2.01 of Mag!X and I have been hearing about a version 3.0. Does it exist? If so, then why hasn't the company informed me of its existence? I had registered it the day I received for my birthday. This was almost a year ago (July). I have not heard one peep from the company that publishes it. Heck, I didn't know Ease desktop was available until I saw an ad for it in ST Format!

I would like to upgrade, but I have no idea how to contact the company (conveniently their only address was on the registration card).

If you know their address, and/or Email address, then please let me know. Could someone also inform me as to what is improved/different with version 3.0.

Thank you,

Rich - THX1138

He is Logic's/Notator's chief developer.

As for the postal address (Hamburg) I have it lying around somewhere, mail
me if you want it.

>to other SoftLink Partitions...the desk top can still look at any floppy I
>choose to put in...and so can the other programs I run in other softlink
>partitions. Only notator seems to have this problem...run alone or in
>softlink.

It sounds like a hardware fault in the floppy drive.

>2) Remove all auto programs such as Warp9. This didn't fix the problem.
> I still use Warp9 with Notator according to specific instructions that
> came with Warp9 concerning Notator.

You shouldn't use ANY desk accs or auto programs with Notator. The only
one that is totally reliable is NVDI.

>It seems like Notator is taking a picture of what ever floppy was in the
>drive at boot up from TOS or something...and not allowing that buffer to

>change with a media change.

Like I said, possibly it could be a fault in the disk change detection.
Try running the program on someone else's computer.

>Might this be an isolated bug with only my particular machine/program?

Well it's never happened to me.

>How/Who do I see to possibly upgrade to a later version?

Ask Gerhard_Lengeling@m.maus.de (Notator developer).

1321. Adding memory

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 09:40:05 UTC
From: kghashgh@nermal.santarosa.edu
Message-ID: <3gic5l$k55@floyd.santarosa.edu>
Source record: 172518

I just tried installing some 1MB simms in my 1040STe, but had a slight problem. Now, I tried two different kinds, one set of four 9 chip simms, and a set of 8 chip ones. Only two of the 9 chip ones worked (with either of the other two in, I just got crap on the screen), so I could successfully get 2 megs of RAM with those. The 8 chip simms acted like 256k simms, giving me either half a meg (with two installed) or 1 meg. Then I tried combinations of the 9 chip ones that worked, and the 8 chip ones, and got four megs, but the system crashed a lot. Is the STe supposed to use only 9 chip simms? It doesn't seem to be so, since the 256k simms that came with it seem to have 4 chips on 'em. Anyone have any suggestions?

Thanks

>
John,

Try using STZIP 2.6 instead, especially if you only have 2.5 Megs or
less, the problem is it is running out of memory before it can extract.
(Might be a bug in the executable portion of the sfx.)

I can get it to connect, but after that none of the servers work.
Try asking in the demon.ip.support.atari News Group.

Also, You'll Need the following info changed to match your INET provider's:

PPP/SLIP login commands. MTU's.

Domain Suffix
SMTP Server
Time Server
News Server
Domain Name Server (DNS) or Name Server.
Hosts IP address.
Hosts Dummy IP address expected...Usually 255.255.0.0 or 255.255.255.255

These things go in your TOMSHELL.BAT file,
Your DIAL.TXT file, STARTUP.NOS file, SMTPRC file and any other news RC
file created (For users) If it isn't changed in ALL of these, you will
probably get hung up on.

Also, Right after loading and going into the Dialer mode, if no text
appears on your screen hit [F-10] then [Enter]. you should see the
DIAL.TXT script info go across your screen.

If you have problems, read your log file, copy it and your setup into a
mail message, (changing your password in the Dial.txt and NewsRC) and
explain y our problem to CO.UK people on demon.ip.support.atari Newsgroup.

You should get an answer.

(I haven't done this yet as I've been to lazy to do all of that. I have done a lot already, including installing it on a Minix partition.)

The Problem with the Installation package is that it expects you to subscribe to CO.UK Demon Internet services and doesn't really provide an easy installation unless that's who you plan on using.

>
> I but mint 1.04 back in the auto folder and 'FSCK' works fine.
>
> Any ideas? Do I need to do something different with 1.12
>
> Thanks for any help.

Yes,I had a similar problem, and found that it was becuase I didn't have the latest version of Minix utilities (Including FSCK.) You'll probably have to rerun Minit. but Older Minix partitions didn't work with Mint 1.12. At least not on my 520 ST w/ TOS 1.4 and 2.5 Meg Ram and a Supra52M HD.
I also found that it is not a good idea to go over the 15Meg Limit on a Minix Partition. As you will lose lots of Inodes.....

(also if you write a 500 byte file or less it still takes up at least 1K of disk space.)

: Computer shops are doing selling the 1 Meg Falcon at 255 pounds???

That was a Gasteiner advert I believe. It DIDN'T include VAT (at 17.5%)
and no-one in their right mind would buy a 1meg machine anyway. So for
the base level one (4meg) you are still looking about about 400-500 quid.

Also I believe Gasteiner are no-longer supporting Atari products in 1995
so the stock they have are their final stock *just a rumour, but a well
substantiated one*.

: .....and please, no demise of Atari comments as they still are producing
: Falcons in their current configuration as market demands.

C-Lab make the Falcon now. Atari have truly given it over.

You make the bow from a piece of LIANA and a stick. You make the arrows from a stick and a feather. Warning.. its bloody hard to use the bow, it moves in real-time so its hard to see what you are aiming at.

Also to make the fishing rod you need the nappy pin, some more liana, some resin and the wire I think. You need to have explored the amazon section to get the liana. You managed to kill the tigers yet? They give you lots of stuff, use their fur with the needle and thread to make yourself some gloves and a hat.

It's a wicked game.. but I am yet to figure out how to kill the Dinosaur on the Amazon stage - help anyone????

I sometimes run X applications over a 14k4 phone line. It works.
It is not brilliant, but not entirely useless either.

If you connect two machines over, e.g. a 115200bps null modem
line with compressed SLIP, that should be an OK solution.

Gee, that's a very helpful point :-/

>updated to support the exstra features which the machines have, (well not
>that much for the MSTE, mostly for the TT).

Tell me which features of a TT have to be supportet explicitly?

All cleanly written software made use of the extra gfx-modes in an instant.
TT-SCSI was supported by the harddisk-software very soon after release.

But I forgot, you only play games. Most of them are badly writtten and highly
machine dependand. You cannot blame this one on the TT, can you? Blame the
authors.

>The Falcon is in some way late, and ofcouse it's slow as well. But then
>we're back to my main point again. Why is the Falcon slow ? because you
>tell it to run old software which hasn't been updated to suit the hardware.

What do you think you have to update to make use of the Falcon specific
hardware? A recompliation with 68020-flags doesn't improve things. And the
music stuff makes perfect use of the DSP, doesn't it?

>So why do they delay such a program in advance of NVDI3.0

For the reason to make money and stay in the market at all. Where do you live
man? Come back into _real_ life.

>claim NVDI is needed more, (or at least they claim they can sell more NVDI
>than the OS). This is something i do not understand about 2B at all. And

You don't understand it as you don not have the insights into the market.

>an Falcon to, for an example, a 68040, if we keep on having this old software.
>So now we have the right speed, (which infact will compete with an 486DX66

A 486DX2/66 is way faster in raw calculating power than a 68040. And there is
no 66 MHz 68040 at all.

>That why you now have possibilities of making an upgrade, as mentioned
>above.

How much are you willing to pay for 68040 upgrade for a Falcon? Compare this
price to the price of a 68040 MAC.

Hey. This weekend I bought Robinson's requiem for the grand sum of THREE POUNDS at an all Formats Computer Fair. I had never heard of it and only bought it because it was cheap. It comes on 3 disks and is HD installable. Should be a good game when I can get around to playing it.

1343. STalker 3.02/Ansi

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 15:39:52 UTC
From: msmith@maxine.jf.intel.com
Message-ID: <msmith.791480392@maxine>
Source record: 172376

I have owned STalker 3.02 for two years and have found it to be a very robust communication application.

I haven't heard any information on upgrades to 3.02 lately. I'm having trouble with the ANSI emulation, especially the terminals ability to recreate the entended ANSI graphics.

Freeze Dried Terminal did a great job of ANSI emulation, but because of it's instability on my system, (and lack of author support at the time), I purchased STalker.

Now, my question.. does anyone know of a way to coax STalker into accurately displaying ANSI graphics, or is an upgrade available that will solve this problem?

Thanks,

Michael

Correct, it is normal as the Atari only has one line to set MotorOn (might be
another signal, but the machine is short of the second one).

>>I've seen Ofir Gal's name appear a few times on recent postings
>>to this newsgroup. How about solving our little problem, Ofir?

>TOS 1.04 STFM and a Falcon).

This only depends on the drive. Some brands have the motor on if only the
drive-select is on (LED is on). Other drives need the Motor-On as well to get
going.

Hello All

Im looking for some Fax software preferably Public Domain.
I found Hackfax at Hensa but all the documentation is in German
also there is no shell with the program.So its not easy to work
out how it all comes together.
Any body had any luck with getting this going.
Eighty odd pounds seems a lot of money for the commercial program
Straight Fax.Is it worth it??
Oh by the way Im using a 1040 STE and 20mg Hard drive with Colour mon.

From: preacher@step.polymtl.ca
Message-ID: <3gj801$hk3@charles.cdec.polymtl.ca>
Source record: 172541

Hello guys!

I own a spectre GCR from Gadgets by Small... The gadget itself is good
but here is the problem: I can't use it anymore!!

My floppy supposed to contain the softwares to start Spectre is now
dead... Probably a bad sector or something like that.... Anyway, the
result is that there is no way to use my spectre!!

I would like to obtain a new copy of these softwares, but no dealer wants
to make me such a copy, pretenting this is not legal... They are not
totally wrong, but not right too... How can I use this software if I
haven't bought the hardware? So wath is the solution? Buy a new
spectre, call Dave Small? Or is there a copy of the Spectre floppy
somewhere available via FTP?

1349. Searching for address

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 17:46:50 UTC
From: darko@tjev.cc.etf.hr
Message-ID: <3gj8ma$3bk@labs2.etf.hr>
Source record: 172542

IMPORTANT, Regarding the text on the top

Recently I got lots of E-mail regarding my text above. So to prevent further misunderstanding, I felt it was needed to write an explanation.

I did buy cracked version of Aura, but from friend, (who by the way is not a pirat) because the program wasn't available for me in any other form (that's why I need the address). Knowing it doesn't work, I used it as a demo (to see how it looks, capabilities, etc.) and I'd really appriciate it if anyone would give me C-lab's (and other's - Sensible Software, Renegade) contact address so I could write them for a catalogue and the program.

In Croatia there aren't any specialised disk shops or even something similar where one could buy desired software for Atari (if there is one or more such places in Croatia or Slovenia please just write it under these text). You'd have to go to another country to buy software. So I'm depending on you, who read this text.

If I get any address I'll give it (them) to computer magazines that are going out in Zagreb so they could publish it (that is, of course if you agree), because when I asked them they didn't have a clue.
I am sure there are many people in Croatia interested in how to order or where to buy original software and would be greatfull for such information.

My appologies for the misunderstanding I caused with a text above. It was miswritten due to a shortage of time and my lack of knowlidge of English language.

Greetings to people of C-lab, Renegade, Bitmap Bros., Langkhor and Sensible software to whose software I'm looking forward to enjoy.

Awaiting for your response !

P.S.: In countries like Croatia people learn more quickly how to appriciate software, because it's hard to find.

>Don't over estimate my knowledge. I have no idea why this happens. I use
>to get it on my old TOS 1.0 STF, but not on newer machines (I now have a
>TOS 1.04 STFM and a Falcon).

This is just a plain simple hardware issue. The Shugart floppy bus (also used in Atari machines) simply has just one MOTOR_ON signal line, so that all drives start spinning when one of them is to be accessed.
Newer drives are a bit more intelligent and don't spin unless there is a disk inserted. Old drives (like the old large-button drives Atari used) don't do that and spin with no disk inserted. With disk inserted, any drive will start spinning.

Why? Because MOTOR_ON comes before DRIVE_SELECT, and the drives can't predict which one will be selected.

bye, Peter

1353. ST to ST via NOS?

Newsgroup: comp.sys.atari.st
Date: 1995-01-30 19:34:02 UTC
From: simon@bassland.demon.co.uk
Message-ID: <791494442snz@bassland.demon.co.uk>
Source record: 172401

Is it possible to have two Atari STs connected together via their serial ports, and have NOS running on one machine....[fine so far]....but, BUT .. have (somekind!) of program (maybe Lynx?), running on the other so that I can ftp from the machine running NOS?

I know of such a program on the PC, but I don't have a PC.

The STARTUP.NOS file will need serious pruning I know, as I only need the second ST set up as an ftp server.

Sorry this plea is a bit general, but I hope somebody will know what I'm talking about.

Cheers,
Simon.

Message-ID: <95030.145628STIRRE31@MAINE.MAINE.EDU>
Source record: 172404

Well, I still cannot get NVDI to print properly after many hours and
countless sheets of paper. I would like to ask the authors of the
program about my problem. Does anyone have an e-mail address where
I could reach them?
In the meantime, is there a way that I could put Speedo on a floppy
drive (in an AUTO folder) and have the Falcon bypass NVDI at bootup?
I was trying to do this but could not figure out how. Doubleclicking
on Speedo from the desktop results in bombs. Changing the printer
driver via driver.prg causes NVDI to have to reinstalled (as far as I
can see).

Try TAZ, it's VERY quick, has it's own serial port routines, thereby
negating the need for a RTS/CTS patch program, handles all the usual
protocols and is generally very good. OK, so it hasn't got all the
frills of some of the bigger progs, but I use it because I get an extra
50-60 cps throughput with it compared with all the others I've tried.

It's lean, it's quick and bug-free...try TAZ today ! Available from all
good FTP sites. [blatant advertisement time].

I presume you are referring to the 'current' and 'parent' directory
selectors, as used in DOS ?

I don't know of a program that will do it with the standard Atari
desktop, but most of the replacement desktops have it. Try TERADESK
1.40, it uses very little memory and is MUCH nicer than the standard
Atari one.

Source record: 172412

Hello to all printer gurus out there..!

I have just completed my ST system with the addition of the missing link, a printer. It's only a small 9 pin dot matrix, but it'll do for what I want.

Now, how does the ST deal with printer drivers ? I'm used to such stuff on the PC, but how do I get my printer to change fonts, go to NLQ mode, etc etc. It is a Philips NMS1438, but according to the menus it prints out, it will emulate an EPSON FX-800 and an IBM PROPRINTER XL.

I don't yet have the manual for it, but it is being sent to me soon.

How do these things work with STs ? I know that the standard Atari control panel only lets me change a couple of things, and I'm not sure if even they work ! I do have Neodesk 4, so I suppose I could use the 'MAKEPRN' program to create a driver, but I don't really use Neodesk that much, preferring Teradesk [it's faster], so for most purposes any driver created with Neo wouldn't be used.

Apart from that, how do I tell the Atari to use a printer driver ???

Thanks in advance.

As you are so fond of saying, Roger... RUBBISH! (or as you spell it, RUBISH) :)

General Electric (the parent company of GEnie) is far from going bankrupt, which is what the US Legal Code of Chapter 11 is all about. However, methinks one could easily compare GEnie to a well known but sliding computer company we are all familiar with. :)

There is a lot of competition amongst the commercial info networks and GEnie is certainly not immune. And given that it's largest percentage of users -used- to be Atari owners the current slack has hurt them a lot, as well.

Both Delphi and GEnie are in the position of being forced to highly revamp their services and attract new customers or get out of the electronic information services business altogether. Time will tell, eh?

>Otherwise, please keep the unwarranted attacks out of it. I take great
>pride in the work that I do for the Atari section of STReport and there's
>been nothing in those pages, for the past year or so, to deserve those
>kinds of comments.

Take it easy, Dana.

First off, it wasn't Steve Wells that claimed STR reported GEnie's imminent demise but rather our own 'beloved' Roger Sheppard <no flames intended, Rog>. Steve was just commenting on Roger's post. If you want to question the claims, go ask Roger for his sources.

Lastly, YOU may take great pride in the work you do for STR, but like it or not, history proves that many others who have written for STR do not share your committment to the truth. STR has a bad reputation (deservedly so, IMHO) to overcome. A name change would have been the smart move but...

I generally -like- your writing, Dana, and have no problem with it. But the company you choose says a lot about you. You could do better, IMHO.

Cheers,

Good Grief! Where does this garbage come from, anyway??? How many Falcons have you physically seen with a 'made by C-Lab' sticker?

C-Lab has only licensed certain parts of the Falcon 'technology' from Atari. They may eventually actually build and market a specialized music workstation of some sort, but that day hasn't come yet.

I have been told that Atari is still manufacturing Falcons 'as the market demands' (yeh, right). Although I personally have some serious doubt about that claim, it sure ain't worth arguing about. :)

I have NVDI 3.01 - it works fine with Speedo & TrueType :). Another advantage is the 'MakePrn'-Tool of NVDI 3.01. With this tool you can create your own drivers for every printer you want (except PostScript ;-)). So you can optimize existing drivers for the printer you have. The results of my old 24-pin-printer are now really great!

Hall and Oates used some in Change of Season. They thank Atari in the liner notes. I know David Grusin (sp?) used one to compose the music to The Milagro Beanfield War (sp?). Geddy Lee of Rush played around with one but likes the Mac better. Circa 1988 he was playing with the ST because it had superior editing stuff, but was waiting around for the Mac library to catch up since he liked finder better than Gem.

NVDI does support *TrueType* fonts and Bitstream's *Speedo* fonts. It does not
support Type-1 PS fonts. The latter is only supported by SpeedoGDOS5.

Source record: 172419

> Firstly, this is my first post on Usenet, so forgive me if I have sent
> it wrong.

Looks okay to me ;-)

> First, I have no idea what MiNTnet, MiNTos are. What are they, and
> what can they be used for?

MiNT-Net is a Berkley type TCP/IP system for MiNT. It implements BSD sockets, SLIP, PPP (I think) and loads of other related bits. There are also ports of many Unix networking tools like 'FTP', 'NFS', 'TELNET' etc.

> I know minix lets you have long filenames. What else does it do? Do
> I need MiNTnet/MiNTos to run minixfs? Will my existing software still
> run under MiNT 1.12/Minix/MiNTos/MiNTnet?

Minix is actually a complete replacement OS which implemented At&T Unix V7 on the ST. It had a number of shortcommings not least that AT&T Unix V7 wasn't all that good (being 1979ish) and Minix wouldn't run on a TT. However it did have an excelent fileing system which allowed long file names, links, inodes etc. A driver for this FS has been written for MiNT in the form of an .XFS file. Although known as MINIXFS.XFS it is often (incorrectly) referred to as MINIX.

> If I have MiNTnet/MiNTos/Minix/X Window, will I still be using the
> GEM.SYS from MultiTOS? Will I still be able to Multitask while running
> these things?

If you want to run X-Windows then you don't use the GEM.SYS. Otherwise you can, though you don't have to. I still use GEM.SYS as its currently more useful to me than X.

> I guess MiNTnet does networking. Does this set up a logical drive and

It sets up a proper unix like BSD TCP/IP system. The big advantage of this is that you can then network with non Ataris. I have a NFS link to my PC running Linux. this is done over the serial line - but if I can get the DE600 adaptor up and running on my TT then I'll have a proper ethernet link :-). This big disadvantge is that MiNT-Net is not easy to set up, especially if you have no prior knowledge of this sort of networking.

> I currently use MiNT 1.12 with MultiTOS on a TT030 32Mhz 8meg RAM
> FPU68882.

Nice machine! (very much like mine ;-) Have you seen my B*ttleZ*ne port (CBZONE10.ZIP). This works very nicely on a TT. :-) <Fx 'plug','plug'>

> I guess there is an FAQ or something somewhere that tells you all this,
> but if there is I could not find it. Apologies if all this is common

We are a little short on FAQs around here. Anyway this whole area is
changing on an almost day by day basis.

:-)

Roland.

But if a Music magazine is going to put a CD-ROM on their cover anyway -
then it still makes sense. What doesn't make sense is an Atari
magazine putting a CD-ROM on its cover - as very few Atari owners could
actually read the disk directly.

BTW I have an external SCSI CD-ROM unit that I use on both my TT and PC.
On the TT it is mostly used for playing music, but on the PC there is
software which really makes use of it.

:-)

Problem is that you aren`t running MiNT _and_ MinixFS. Try putting
MINT.PRG in your AUTO-folder and MINIX.XFS in C:\MINT\ or C:\MULTITOS\.
Reboot and try again! This time it will hopefully work...

(When MiNT starts it will search the two folders mentioned and start
any .XFS (and .XDD) files.)

> in the auto folder and minix.xfs in the root.

Have you checked that MinixFS is running?

The problem is that MiNT v1.12 does not search the root. You will have
to place MINIX.XFS either in C:\MINT\ or C:\MULTITOS\ in order to
get MiNT to start it up.

> I but mint 1.04 back in the auto folder and 'FSCK' works fine.

I don`t know exactly when the behaviour changed, but it wasn`t very
long ago. That`s why it works with 1.04 but not with 1.12...

1379. Falcon Questions

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 02:20:41 UTC
From: ap748@cleveland.Freenet.Edu
Message-ID: <3gk6pp$igq@usenet.INS.CWRU.Edu>
Source record: 172424

Hi,

I have some Falcon specific questions. I never really considered buying
a Falcon earlier but the more I work on OS/2 based machines with all the fun
stuff like CD-ROM and true color graphics, my ST with a max of 16 colors
running at 8mhz is kind of a drag. Multi-TOS help out but at 8mhz it still
doesn't have the power to do the OS justice. Here are my questions in order
of importance to me.

1. What is the highest screen resolution a standard Falcon can do?
I heard that it covers all three standard ST resolutions plus 640x480x256 and
640x480x64k. But does it go above 640x480 with out any extra hardware?

2. From what I've seen advertised I can use a VGA or better monitor. To use
my SC1224 or SM124 I need an adapter. With this adapter I understand I can
use my older ST monitors on the Falcon, but since this gives them a 15 pin
VGA plug can I use these monitors on my IBM in standard VGA mode of
640x480x16 or 640x480x256?

3. What is the standard internal hard drive size. I've heard 65 or 80 meg
is standard. I assume I can put a 500 meg in also if it is small enough.
IDE is the internal format. Can I put a SCSI in it?

4. I see them advertised at 1, 4, or 14 Meg of RAM. If I get a 1 or 4 Meg
machine is a RAM upgrade as simple as popping in a standard 72 pin 4 Meg
SIMM, or do I need some fancy RAM board like on the old ST line? Is 4 Meg
enough or is like most of todays x86 or MAC machines 8 Meg the real minimum?

5. I've seen Falcons put in tower cases and a kit called DeskTopper? Are
these available in the US?

6. I've seen Falcon prices in the UK drop in the last couple of months, what
about here in the States?

7. Did the Falcon Speed 386 or 486 ever come out? I see the 286 version
advertised. How does this device plug into the Falcon? Does it use the
Falcon's RAM or does it require it's own?

Hutch,

I realize that Steve didn't claim that STR reported the alleged imminent demise. However, he did comment on what he perceived the source, according to Roger. My message was to correct both message, all in one.

>Lastly, YOU may take great pride in the work you do for STR, but like it
>or not, history proves that many others who have written for STR do not
>share your committment to the truth. STR has a bad reputation (deservedly
>so, IMHO) to overcome. A name change would have been the smart move but...

>I generally -like- your writing, Dana, and have no problem with it. But
>the company you choose says a lot about you. You could do better, IMHO.

Haven't we had this discussion before?? <<rbg>> The possibility _always_ exists that I could branch out in the future. I'm always considering the options open to me. Some support is there, and some isn't. I've also got to weigh, realistically, where Atari is headed and try to determine if it's possible to do what I do now in an Atari-specific mag. I'd like to think so. We shall see...

r > My aim is eventually (in about 6-12 months) to get a fax/modem.
r > I'd like to know what formats Straight fax accepts. For example
r > scan an image and send it? Use .PAP docs etc?

Here is the list from the STraightFAX manual:

it will allow the sending of: ASCII Text files, standard monochrome GEM Image files (.IMG), high resolution Degas or Degas Elite files (PI3 OR PC3), GEM Metafiles (.GEM), monochrome PCX graphic files (.PCX) and FirstWord, First Word plus, or WordWriter ST document files (.DOC). PRinter drivers are included for Calamus, PageStream, That's Write 2, and GDOS applications "print to disk" FAX format.

You can Scan pictures directly into STraightFAX if you have Dr. Bob's Scanlite software.

Hope this helps...

ICD AddSCSI plus is good provided you can house it, power it and cable it yourself - at least that's what I did and added a pair of old Mac drives that I got for a crate of soft drink.

1383. REQ GEMAR220 (still)-:

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 06:48:57 UTC
From: zrollinso@cc.curtin.edu.au
Message-ID: <1995Jan31.154857@cc.curtin.edu.au>
Source record: 172428

A while ago I requested info on SCSI tape drive backup software and a few
kind netters replied and pointed me to GEMAR220 - specifically GEMAR220.LZH
from micros.hensa.ac.uk under micros/atari/tos/n/n107

Well, I did manage to find the above mentioned distribution and FTP'd it to
find that lha complained that the archive was broken.

Has anybody else had this problem? I also fetched the latest lharc from the
same site and tried that - same result.

I also tried to xmodem the file (same result) and even got somebody else to FTP
the file for me (just to make sure) and I still cant unpack the archive.

So it looks to me like the file at micros.hensa.ac.uk is corrupted. Where else
is there a copy of GEMAR220? I couldn't find it on atari.archive.umich.edu
(doesn't mean it isn't there, it just means I couldn't find it :-)

thanks

Take a look at the rest of the world - they don't optimize their (system)
software, they just throw in raw processing power. I do not like this
fatware trend, but I would prefer to at least have the *option* of
a decent upgrade path (in the form of *official* Falcon successors,
not some homebuilt speeder card - oops, I'm starting to dream now).

Summing it all up, I think we're not far apart in how we see things.
I don't want to spoil your enthusiasm with my comments. I'm happy
that folks like 2B and (on the other side of the consumer fence) you
are still here. This is what will make sure that my good ol' ST and
TT computers will be useful for another two or three years which is
definitely A Good Thing.

Oh yes, and I also hope that MagiC will soon support the Falcon.
Thinking about it, not having proper Falcon support is also
detrimental to MagiC on ST and TT since it always leads to
compatibility issues ("Program A runs fine on my TT under MagiC -
but will it crash under the Falcon's MultiTOS?").

> How does the disk format DEAD SECTORING work, and
> does it only work for 9 sector disks..??

I guess you're talking about marking bad sectors, right?

The basic principle is this: Check all sectors on the drive.
For every defect or flakey sector, enter a special entry
for it in the FAT which says "don't use this cluster".
Note that if *one* sector in the cluster is defect, the
whole cluster will be blocked using this scheme. Usually,
you have 2 sectors per cluster, so you lose at least
1 KB per defect.

GEMDOS will not write anything on those specially
marked clusters. The scheme does not work for defects in
the bootsector/FAT/rootdir areas. The number of sectors
per track is irrelevant for this scheme, it will work with
any kind of floppy disk.

> How come you are not in a software division with HP,
> or am I wrong on that one...??

Oh, this *is* a software division (CAD stuff).

: Small question for all those who seem to know more abou Metados than
: I do ;) as I know nothing abouth metados.

: WHat version do I need to get the one that supports audio commands?
As far as I know, you may need to buy a commercial version of a CD-ROM driver.
I know of CD-Tools, the CD extension of the SCSI-Tools (Am I right, Julian ?)
And there is another package known in Germany as Egon-CD.

: Thanks

Actually you are some way off here... AFAIK it's about .8 to .9 MIPS!!
The falcon speed is correct if you only use the ordinary CPU, and not the
DSP which is rated at about 16 MIPS.

MIPS isn't a very good measurement though.
If I use 'nop' or 'moveq' or something like that, I can get the standard
ST-CPU to do about 2003200 instructions in a second.
When using slower instructions like 'movem.l' using say 8 registers I get
it to do 105431 instructions in a second.

> with it seem to have 4 chips on 'em. Anyone have any suggestions?

Your 9 chip SIMMs seems to be 1MB each.
Your 8 chip SIMMS seems to be 256kB each.

As you say, they work separatly, but not together.
This is not really true. There is a bug in the OS of the STe that makes your
machine crash.
All memory configurations is OK, except 2.5MB. This makes the machine think
it has 4MB and it works till it runs a program that uses the upper 1.5MB.
The simplest solution is to use 2MB and skip the rest. Otherwise you'll have
to run a little tool that fixes this, every time you boot.

The number of chips on the SIMMs doesn't matter. The 9th chip is used by some
PCs for parity check.

>the other during some types of font handling? Will they conflict? I have
>SpeedoGDOS v5 and am thinking about buying NVDI. Any info appreciated.

NVDI3's manual recommends to use it without SpeedoGDOS. This is quite a
reasonable statement since NVDI3 includes all the functions of SpeedoGDOS5
except the Type-1 fonts. Besides, NVID3 alone is faster than NVDI+SpeedoGDOS.

There may occur problems with the printer drivers because NVDI3's drivers
won't work if used by SpeedoGDOS. On the other hand SpeedoGDOS printer
drivers can be used with NVDI3.

It is possible, because the 68000 can address 16Mb.
You need another MMU and probably also another GLUE chip, to get things working.

1398. Another minixfs question

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 11:36:12 UTC
From: pd@mole.bio.cam.ac.uk
Message-ID: <3gl7bc$29e@lyra.csx.cam.ac.uk>
Source record: 172444

OK. I have finally managed to make a minix partition on my disk.

When I used the configuration program to check it, it said the four options (directory, execution etc) where TOS domain. At that time it wouldn't use long names.
So, I used this program to change everything to Mint domain. Now it works really well. *Except* that whenever I reboot, it changes back to TOS domain, which means I have to change it back everytime I switch on the machine, which is a major pain!

Any ideas?

Phil

Right, now I have a minix partition (see earlier post!) I am now trying
to get X to work.

I have uncompressed the files in net-060.zoo and X11R5.zoo and tcsh602.zoo.
What next?
I tried running startx and xinit using mupfel (from gemini) and it
complains about files missing and generally doesn't work.
Tcsh will run but all I can do is change directory. I'm obviously missing
something here...

Is there a step by step guide to installing X etc?
Or does anyone have a directory listing of their set-up so I can check I
have everything in the right place?

I think it's quite important to get a package that is easily installed
and that works. It doesn't necessarily have to be the latest version,
just something to get you started.
All the instructions I have seen so far seem to assume you know what you are
doing anyway.

Thanks for any help,
Phil

>Bigger logical sectors are the only way to get large partitions, and any
>software should be able to handle them. Atari's AHDI 3.00 specification
>documented this back in 1988, so don't bother about what your (pretty old?) ICD
>booklet says. Mentioning this, this booklet also states that booting off a
>large partition ("BGM partition") is impossible, which is also not true.

Well I will quote what is stated on page 49 of my ICD book, that has a date code of 36-90 on the back...

This allows a total of 3.5 Gigs of active drive storage and 7 gigs with TOS 1.4 and above...

Using the ICD Desktop acc, up to 32 gigs can be accesed by the system and 64 gigs with TOS 1.4 and above...

I wish people woulds stop quoting from old versions of the manual, what we need here is real facts, and less of this drivel that I keep seing here...

Hi everybody,

for a friend who owns an ST520, I'm looking for a spreadsheet software.
I found some in the Applications/Spreadsheets/ directory of the Atari
archive; which one is the smallest and easier to use ?

Second question: I have only access to the Atari archive using a Unix machine
with a MSDOS disk drive. Which tool should I use to produce a disk with
the TOS format (I also can use a PC) ?

Thanks

--Pascal

> with it seem to have 4 chips on 'em. Anyone have any suggestions?

You _could_ have a problem with your PSU. Some PSUs are so weak they
can`t even drive some extra RAM. Try unplugging all other devices and
plug in the SIMMS again. If you have an accelerator you could try
to boot the computer in 8MHz mode (the processors powerconsumption
increases 4-fold for each doubbling of the clockspeed, IIRC). If this
still doesn`t work you could try to feed the computer from another
PSU (your local repair-store should be able to help you test this).

AFAIK you should be able to mix both 8 and 9 bit SIMMS without any
problems. The Atari just ignores the extra parity-bit in the 9-bit ones.

Hutch (hutch@ilmen.lanl.gov) wrote:
: In a previous article, cm3hirjd@bs47c.staffs.ac.uk (Requiem) wrote:

: > C-Lab make the Falcon now. Atari have truly given it over.

: Good Grief! Where does this garbage come from, anyway??? How many
: Falcons have you physically seen with a 'made by C-Lab' sticker?

Wait and see. They will retain the Falcon logo and drop the Atari
symbol, they will have the MIDI connections and hardware that the Falcon
should have had from the start. Falcon-II will essentially be what
Falcon I should have been to MIDI musicians everywhere.

: C-Lab has only licensed certain parts of the Falcon 'technology' from
: Atari. They may eventually actually build and market a specialized
: music workstation of some sort, but that day hasn't come yet.

And it won't take long until that day does come...

: I have been told that Atari is still manufacturing Falcons 'as the
: market demands' (yeh, right). Although I personally have some serious
: doubt about that claim, it sure ain't worth arguing about. :)

You are right it ain't worth arguing about. The head honcho of C-Lab was
at the London Atari show before Christmas and was looking around at the
stuff on display (ie Apex, etc...) and was suitably impressed so as to
not want to change any of the internal design for stuff like graphics
hardware. They are the ones who will control the Falcon's destiny now
and in all honesty its a good thing, because someone has to, Atari
certainly havn't been much cop up until now.

The following items are still for sale! Great prices for a lot of great Atari equipment!

All software comes with manuals and, in most cases, original boxes. Of course, some of it never came with a box in the first place...

All software and hardware has been tested (used fairly often, actually :-) and works.

All magazines have lots of reviews, articles, and disk-based mags have software, some of which is not listed.

Add shipping to all prices. Orders of $100 or more receive a 10% discount.

Prices and terms are flexible, so make me an offer!

Questions? Ask away!

Please send all offers and inquiries to the following address:

t.hopper@genie.geis.com

Tom Hopper

No, you can use 3-, 8- or 9-chip SIMMs. A parity bit is not required.
I have already used 4x 3-chip SIMMs, it works perfectly.

I didn't think the Atari did parity checking, but I wasn't sure.

>
>--
>Stefan Berndtsson - gubsb@trivux.ub.gu.se
>

Hmm. I thought that they could be 256k at first, but I checked it on a
friend's Mac, and every chip seemed to work just fine at 1MB. I see now
that it would crash when using the upper 1.5MB, which confirms that the
Atari thinks those 8chippers are 256k. As for the 9 chip ones, even though
only two worked on my Atari, all four worked on my friend's Mac. Oi.

I have a original ATARI 2 MB ST-RAM expansion card for the TT030 for sale.

Adding this card, the available ST-RAM comes to a total of 4 MB
(2 MB on the main board and 2 MB on the card).

If interested, send an offer via Email to:

The XIMG format has never become popular in this country.
We could make a driver for every format in the world, but you have
to draw the line somewhere. I guess I would just say that it would
be best to use GEMview or Imagecopy to convert the image to something
we do handle.

1427. Toad Computers Internet Support

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 19:20:23 UTC
From: "Toad Computers, Inc." <toad@charm.net>
Message-ID: <3gm2hn$hhv@canton.charm.net>
Source record: 172383
Cross-posted to: comp.sys.atari.st,alt.atari-jaguar.discussion

TOAD COMPUTERS ANNOUNCES INTERNET SUPPORT SERVICES 01/31/95

Toad Computers is proud to announce online support on the Internet, including a World Wide Web (WWW) homepage, an ftp site, and e-mail for sales and technical support.

The World Wide Web homepage allows customers to get product information (like Jaguar game screenshots and availability dates), request a catalog, learn more about Toad Computers, and view Atari-related graphics and animations. Right now, the Toad Homepage even allows online ordering of some products, like clearance games.

In addition to resources specific to Toad Computers, the Toad Homepage offers pointers (or hypertext 'hotlinks' as they are called), to other Atari-related resources on the Internet including software archives, newsgroups, and other Atari-oriented WWW homepages.

"We believe that the Internet is an important new medium," says Dave Troy of Toad Computers, "and if it helps us to provide better service to our customers, we want to be a part of it." While there is no graphical 'Mosaic'-type WWW browser for the Atari, Toad Computers is very interested in seeing one developed. According to Dave Troy, "Hypertext Markup Language (HTML), the raw text underlying the Web, is extremely straightforward. The tricky part of getting Web access on the Atari is the TCP/IP connection that PC's can get using a program like Trumpet Winsock. Once a PPP (point-to-point protocol) connection can be made reliable, a web browser should be fairly easy to implement." Right now, there are a few packages (such as KA9Q/NOS/STNET/MintNet) which deliver PPP access on the Atari, and ZFC (the makers of Edith Professional) have been talking about writing a graphical browser. It is likely that before the end of the year, software should be available to allow Atari PPP and WWW access through a variety of local Internet access providers.

For now, to access the WWW homepage, Atari users will have to use Internetworked PC's or Mac's equipped with a 'Mosaic'-type browser. In addition, America Online (also accessible through Mac's and PC's), will be offering graphical WWW access this winter. "It shouldn't be too hard for someone to find a Mac or PC running Mosaic. Many Atari users use these systems at work, and they can also be found on just about any school campus -- from university to community college, everyone is running Mosaic!," says Troy.

An ftp site is also available for Atari users to download files that pertain to Toad Computers, such as our SYSINFO system & modem tester, STraight FAX! support notes, and ordering information. Right now, CompuServe, America Online, and GEnie all offer limited FTP access, so users of these services should have no problem accessing this site. And of course, any machine on the Internet can be used to access this site using a conventional ftp client. The KA9Q PPP package for the Atari includes a built-in ftp client.

Toad Computers has always been available through e-mail, but Internet e-mail allows greater flexibility and faster response times. "With our e-mail on GEnie, it has always been a project to read it and respond quickly," says Troy, "and that has been particularly true with the huge volume of mail we received after mailing our most recent catalog."

If you have sent e-mail to the 'toad@genie.geis.com' address, please be patient; it will be answered. However, for an immediate response, please direct all e-mail to our new address, 'toad@charm.net'.

Toad Computers does not plan to stop visiting the Atari ST/Jaguar Roundtable on GEnie. "GEnie has always been a core part of our online support, and we appreciate the relationship we have developed with customers and developers there. We will continue to post specials and news files on GEnie, and we will also continue to be involved in the Bulletin Board areas," says Troy. And of course, any e-mail received at 'toad@genie.geis.com' will be answered. However, customers are once again reminded that response will be faster if e-mail is sent to 'toad@charm.net'.

Toad Computers Internet addresses are as follows:

WWW Page: http://www.charm.net/~toad/

Anonymous FTP Site: ftp://ftp.charm.net/pub/home/toad/
(ftp to ftp.charm.net,
go to pub/home/toad directory)

E-Mail: toad@charm.net

E-mail from GEnie: toad@charm.net@INET#
(@INET# instructs GEnie to use
their Internet e-mail gateway)

For more information, Toad Computers may be reached by mail, telephone, or FAX as well.

Source record: 172372

Hello, again.
I'm the hoser who asked the 68000 assembly question, and since having
been enlightened, I'm searching for a system to get up and running. I've
had an offer from this one guy around here, and since I have little idea
as to what a reasonable system is worth, was wondering if you could helf
me out...

This is the deal:
$475 for an 1040 ST w. 4 megs (new, supposedly),
or
$325 for the same machine with 1 meg (used).
$175 for a monochrome monitor, $200 for color (I'm guessing used...)

Again, sorry for taking up bandwidth here...

- rex

>use that will allow you to do just this. But I can't contact Dave Small
>anymore and I need help with this one!!!

>Thanks..

>James Schofield

James: Please describe exactly what happens when you go the chooser, is there
a driver there for you to choose? If so, what happens when you try to print
from your software?
If no printer driver in chooser, can you print in Atari mode?
If you can print in Atari mode, have you thought about printing to file in
MAC(command-K, I think), taking off that ps file to floppy; booting to Atari
mode; and sending the file to your Laserwriter?
Bonne chance

1433. [REQ] informations on the PAK68/030?

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 20:51:52 UTC
From: jmb@cao-vlsi.ibp.fr
Message-ID: <3gm7t8$77g@vishnu.jussieu.fr>
Source record: 172375

Hi,

I'm looking for informations on the PAK68/030 card. I own a Mega ST, and
this card seems to be the perfect solution for me.
All I know is :
* 68030 (?? MHz)
* fast ram expansion slot (?? Mo)
* faster than a TT (Qindex? Gembench?)
* suitable for a mega ST box
* needs 68000 unsoldering (OUCH!)

But what about :
? TOS versions
? compatibility
? FPU slot
? Linux development

Have anyone here more information ?

Thanks.

1434. Problems with games and 4Mo ST ! (F29)

Newsgroup: comp.sys.atari.st
Date: 1995-01-31 21:09:25 UTC
From: jmb@cao-vlsi.ibp.fr
Message-ID: <3gm8u5$77g@vishnu.jussieu.fr>
Source record: 172377

Hi ST gamers,

My little brother complains to me since I added 4Meg to my mega ST.
It seems that some games don't like extra memory space. I also remember
having seen on game boxes some sticker mentionning MegaST4 compatibility
problems. (One of them was Epic)

Does anyone know why such problems arise ?
Is there a way to fool the system ? (some kind of resident memory hunger?)

His biggest gripe concerns F29. What would you suggest as a flight sim
replacement ?

Fred Horvat (ap748@cleveland.Freenet.Edu) wrote:

: 1. What is the highest screen resolution a standard Falcon can do?
: I heard that it covers all three standard ST resolutions plus 640x480x256 and
: 640x480x64k. But does it go above 640x480 with out any extra hardware?

I'm not sure about actual sizes obtainable, but _software_ like BlowUp030
and hardware like ScreenBlaster will do things with your resolution even
Atari hadn't planned on.

: 2. From what I've seen advertised I can use a VGA or better monitor. To use
: my SC1224 or SM124 I need an adapter. With this adapter I understand I can
: use my older ST monitors on the Falcon, but since this gives them a 15 pin
: VGA plug can I use these monitors on my IBM in standard VGA mode of
: 640x480x16 or 640x480x256?

Who knows? That's a PC question :-)
You will need a VGA adaptor if you want to plug in a VGA monitor, they
don't slot in direct. Same goes for RGB ones and SCART. TV plugs in
direct but I've had heck of a trouble getting a decent picture on a TV.

: 3. What is the standard internal hard drive size. I've heard 65 or 80 meg
: is standard. I assume I can put a 500 meg in also if it is small enough.
: IDE is the internal format. Can I put a SCSI in it?

2.5" IDE is the standard _internal_ size. Atari used to ship with 65meg
hard drives but when they stopped manufacturing 65meg drives Atari moved
up to the 80meg instead. But whoever you purchase your Falcon from will
no doubt kit you out with whatever size HD you require. I'd go for
nothing less than 170 meg to be honest, although saying that I still have
only 80meg to play with (and I really want more, hence my advice).

You can't put a SCSI _in_ your Falcon I don't think. But you can
certainly attach one.

: 4. I see them advertised at 1, 4, or 14 Meg of RAM. If I get a 1 or 4 Meg
: machine is a RAM upgrade as simple as popping in a standard 72 pin 4 Meg
: SIMM, or do I need some fancy RAM board like on the old ST line? Is 4 Meg
: enough or is like most of todays x86 or MAC machines 8 Meg the real minimum?

For the Falcon 1 meg doesn't do it justice - hell lots of software won't
even function with a mere meg of memory. 4 meg is standard, I am yet to
find a package that doesn't operate within 4 meg of memory. But like all
things in life - the more the merrier. If you are going to be using
Cubase then you *really* need 14 meg memory. I am not 100% sure but I
think the Falcon has an odd SIMM set-up, all I know is upgrading from
4meg to 14meg will probably cost as much as you'd pay for the machine itself.

: 5. I've seen Falcons put in tower cases and a kit called DeskTopper? Are
: these available in the US?

The Tower case is an extremely nice set-up, I believe System Solutions
sell it over here (UK) but as for US.. who knows? I would not really
recommend the DeskTopper simply because it looks... well.. ugly! But if
it provides what you want, its certainly cheap.

: 6. I've seen Falcon prices in the UK drop in the last couple of months, what
: about here in the States?

Pass.

: 7. Did the Falcon Speed 386 or 486 ever come out? I see the 286 version
: advertised. How does this device plug into the Falcon? Does it use the
: Falcon's RAM or does it require it's own?

It uses the Falcon's RAM and plugs into the internal expansion port. the
286 board is actually quite nice and even runs Windows (although only in
16 colour mode). A German company were supposed to be working on a 386
and 486 board, but nothing has been seen yet. Doesn't mean nothing will
be seen mind you, just means you couldn't rush out and buy one if you
wanted.

Almost every couple of days I seem to notice a request for an
HTML reader. Now, while Lynx is fine, it doesn't quite do the job in
being user-friendly. I know that various people are working on GEM
HTML readers, but I've just had a thought.
How about an HTML to 1st Word Plus format converter? I've thought
about it, and it's totally workable. Before embarking on the project,
I'm just wondering if anyone would have a use for it? Is this something
people would like? Have you got any other ideas?
Yes, I know, so you'll lose the graphics and can't use it
realtime if you have a SLIP-link. But it could be neat!
Oh, and would anyone send me HTML files that they think are within
the HTML standard, yet still a tad weird. You know what I mean...

Ta, Leon.

The title says it... I would like to buy a working 800xl so that I can play my old games that are still good. My 1050 drive still works, but when I boot my system it will not recognize the disc drive??? Any suggestions (other than this is the 90's and get real) would be appreciated.

I ahve heard of this somewhere. Is it PD/Shareware/Commercial? Is it still
supported? Is it MultiTOS friendly/enhanced (it is mainly for MultiTOS that
I want to switch to a better editor).

Yikes, unless you have more than 4 megs of memory you haven't got a hope
in hell of succeding here! Gemini is huge, and so is X. Basically, to run
X on a four meg machine you do it from mint.cnf before GEM loads.

> Tcsh will run but all I can do is change directory. I'm obviously missing
> something here...

Yes, the GNU fileutils. tcsh and most unix shells have no built in commands,
they need external programs.

> Is there a step by step guide to installing X etc?

Sort of... you follow the MiNT step by step guide, then the MiNTOS step by
step guide, then the MiNTNet step by step guide, then finally the X step
by step guide. You're right, it would be useful for someone to write one
(oh no - NOT me ;-)

> I think it's quite important to get a package that is easily installed

Message-ID: <3gmmhj$c1j@netline-fddi.jpl.nasa.gov>
Source record: 172392

My brother has a 1040 with mono and 2 floppies (no, it's not his girlfriend).

He has a Star SB-10 printer, a 14.4kb data/fax modem, Uniterm and STraight FAX!

He's never been able to do a screen dump. What does he need to do a screen dump to the SB-10?

STraight FAX! doesn't support his printer directly. Now what?

Uniterm knows about 9600 and 19.2, but not 14.4. Does the ST know about 14.4? If so, can you recommend a PD/SW/FW comm program (in English) that knows 14.4 (preferably with ftp://archive/path -- "somewhere" is hard to find, even with xarchie).

I don't know ST well -- it's my brother's machine (I don't think he knows it very well either).

Send e-mail -- I don't read this column often.

Thanks in advance.

The age old, if a little slow, 1st Word would do, although it has no
checker; there are one or two PD checkers around. Marcel (shareware) is
excellent. Several other free/share-ware WPs have appeared of late, but I
can't give you much on them as I use Marcel, Protext or WriteOn for most
work.

>>an Falcon to, for an example, a 68040, if we keep on having this old software.
>>So now we have the right speed, (which infact will compete with an 486DX66
>
>A 486DX2/66 is way faster in raw calculating power than a 68040. And there is
>no 66 MHz 68040 at all.

Actually, the 486 has an average of 1.8 cycles per instruction, while the
68040 rates at 1.4, yielding about 37 MIPS for a 486 running at 66 MHz, and
about 31 MIPS for a 68040 running at 44 MHz. Faster, yes, but not exactly
way faster.
A second point -- there is no more a 66 MHz 486 than there is a 66 MHz
68040. Both reflect clock doubling, so the comparison is fair, in which case
the 68040 should be compared at 47 MIPS or the 486 should be compared at about
18 MIPS. One way or the other, at least try to compare apples to near-apples
(no pun intended) and oranges to oranges. Of course at the clock doubled
rates, the numbers should actually be smaller than the ones I've given, due to
wait states and whatever, but the ratios should more or less remain intact.
A third point -- the 56001 in the F030 is rated at 16.7 MIPS, so the
software that is written to take advantage of the DSP **can** compete with a
486. Granted there isn't much (Apex Media being a very notable exception, but
there are others) software that does use the DSP, but the capability is there
for certain applications.
A fourth point -- since we're discussing MagiC here, tell me what on earth
you're planning on running on a 486 that will touch MagiC for speed, when
running on a similarly powered machine. When things like loading time are
taken into account, my compute 4 megabyte Falcon is much faster than my
roommate's 486 DX2-66 with 4 megabytes. Obviously that isn't a fair comparison
though, he's running Windows 3.1. >:)

>
>How much are you willing to pay for 68040 upgrade for a Falcon? Compare this
>price to the price of a 68040 MAC.
>

Probably $200.00 Canadian. >:) I probably won't see it either though,
but luckily I'm fairly happy with the speed of my Falcon with FPU right now.

1452. Where is Alcyon C compiler?

Newsgroup: comp.sys.atari.st
Date: 1995-02-01 04:05:11 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950131200214.6018D-100000@PEAK.ORG>
Source record: 172400

I want to teach myself C with an old book for the ST. In it, they refer to the Alcyon C which came with the ST developer's package (circa 1985-1986, I believe).

They also say that Mark Williams C would be a good choice, and some others. I don't see these names around ANYWHERE anymore.

What happened to Alcyon C and Mark Williams C? Are there used ones available? Are they inadvisable? What filled the void?

What is the difference between "C" and the "C+" and "C++++++++" (however many plusses). I take it the plus version is a PC thing?

Help me learn to C!

Thanks!

James

Was the computer and hard drive on at the time you plugged the SCSI cable in? If it was that could be your answer, it may be shot by a spike and if so is probably too expensive to repair. I would recommend that your friend get another ST unless you know any techie friends that may be able to pull it to bits to look over it. If an FM is all that is needed get that as they are often available for next to nothing. I bought a second ST, a 520 STFM with 512K and DS DD, for about US$50 and had some chips at home to upgrade the memory so it cost nothing more to get 1Mb.

> During the several times that I was able to boot (before the above-
> mentioned total failure) I used ICD's software to scan the SCSI bus
> and never saw the drives. I tried scanning for the drives both
> with drive parity enabled and disabled.

As the Link 2 is capable of working with parity both enabled and disabled (according to the specs) it shouldn't make any difference to the results obtained.

If this drive is a homemade setup (ie. the drive mechanisms were obtained and plugged into a SCSI bus connector to the rear of the drive and then out onto a standard SCSI connector which the Link 2 plugs into. It seems implied that you only plugged in the connector one way, it may well have been the wrong way. I built my second hard drive system that way and on one of the two mechanisms used was connected incorrectly, I turned it round and it worked ok. If it is a factory manufactured drive in case then disregard this paragraph.

You say 'drives' which makes me think that you may have to many or too few SCSI terminating resistors. These resistors or normally installed on the drive in the factory and if you are using multiple mechanisms then it will be necessary to remove all of these except for the ones present on the last drive on the physical SCSI chain (ie. the drive at the end of the cable). Terminating resistors are usually founded directly behind the SCSI connector on the PCB under the drive and little packages with about ten legs on them in a single line. They should be easy to remove and appear quite obvious as there are normally three of them but occasionally more or less. If the terminating resistors are not installed properly there can be all sorts of problems.

> Please help! Either by direct mail or followups here.
> 1. Is the system recoverable?
I don't know without more info, does the drive still work when plugged into other machines. If the STF is stuffed it will probably be very expensive to repair because it sounds like something in there has blown, not simply popped out of place.

> 2. What is the problem with the Link2?

I personally have found nothing wrong with my Link2, some of my friends also have them and it is probably alright.

Feel free to write to me for more assistance:

Anthony Green

Hi everybody,

I've got one hell of a problem.
I have one PC (I'm sorry) and one Mega-II and one deskjet printer.
I bought a printer switch (automatic) to hook both machines to the
printer. The problem is that the PC prints allright through the
printer switch but my Atari doesn't!!! Not from the desktop
and not from Wordplus.
I do want to keep using both of my machines, but how?
What do I have to do to hook up my atari correctly to the
printer switch?

My TOS is dated 1989

Please answer by email, since I am not able to read the
atari newsgroups on a regular basis.

Don't want to offend the seller, or anything, but that sounds quite high to
me. I bought my 1040STe about 5 years ago brand new with 1MB for $385. In
my local newspaper, I've seen people selling 520 and 1040STs for less than
$100.

>$175 for a monochrome monitor, $200 for color (I'm guessing used...)

I thought I saw someone on this newsgroup a couple days ago with one for,
like, $90 or $75?

Speaking of memory, what size SIMM does the Falcon take? Is it 72 pin or
(uh, thirtysomething...)

Any reason for the 14meg config, as opposed to 16meg? I think I though I
could kind of remember reading something years ago that said the last two
megs were used for memory allocation, or something... And why didn't they
make it so it could take 8 megs?

Are there any old-timers out there who used to use Uniterm????

This was my *favorite* terminal program. It did everything! I remember I was doing a lot of logging-on to the VAX at the time, to write those silly COBOL junk programs.

Uniterm was mah-vel-ous. It even offered SMOOTH scrolling!!! I don't know of any other terminal program that can do that.

What happened to Uniterm, and the author, Simon Poole?

There is nothing wrong in an *not-official* upgrade, as you prefere to
call it. The PC (IBM compatible), is based on 3th party hardware. And
trust me, they love it!

>

>but will it crash under the Falcon's MultiTOS?").
>

That could become another problem ofcouse. But i doubt the incompatibility
will be such a great problem. Both should still be TOS compatible you know.
And i don't mind if Magic for the Falcon is written only to run on the
Falcon. Thats the whole idea here. I don't wnt just another program which
i can chose to run on my STE or my Falcon, unless it supports the features
in both machines. If i get just another program which is TOS compatible
but will ignore the features in my Falcon, then there isn't any idea in
buying a Falcon. I could just have bought an upgrade for my STE insted.

640x480 on VGA. And you can't go beyond without exstra hardware/software.

>

hmm!.. Not sure i understood this.
If you chose to run VGA, you need an VGA adaptor. If you chose to use your
old monitor such as the SM124, you need another adaptor.

>
>3. What is the standard internal hard drive size. I've heard 65 or 80 meg

>IDE is the internal format. Can I put a SCSI in it?

Both are standard. But you can plug in whatever 2.5" IDE drive you want.
You got the Scsi II port on the back of the Falcon, so there is no need to
put in an internal Scsi drive, but just use external.

>

Unfortunatly you'll need a RAM board for this, as Atari did their own
RAM board which isn't compatible with SIMM ram. But these SIMM boards are
available at a very low price, so often you'll chose to buy an Falcon
without RAM, (or 1meg) buy and SIMM upgrade and plug it in insted.
Much cheaper!

I've only seen the 286. But the Baracuda (a 68040 which is going to make
your Pc clone looks silly), is supporting an 386SX.
Both uses the internal RAM, as far as i know.

1462. WTB: host adaptor and case

Newsgroup: comp.sys.atari.st
Date: 1995-02-01 09:54:21 UTC
From: johns@haiti.gsfc.nasa.gov
Message-ID: <JOHNS.95Feb1095421@haiti.gsfc.nasa.gov>
Source record: 172320

I have two Seagate SCSI hard drives (40MB and 100MB), that I would like to put in a case and use with my 1040ST. So, I am looking to buy a case and host adaptor.

If you have a ready-to-go case/adaptor combination you are willing to sell, please email me with your price. I don't want to buy new, because it is just not worth alot of money to me to put 140 MB on line. But, I'm willing to pay a reasonable used-market price.

HM> Gee, that's a very helpful point :-/

Depending on from which side you're looking.

HM> Tell me which features of a TT have to be supportet explicitly?

The FPU and the LAN. The VME cost damn lot of money, and still miss alot
of features/cards. Look at the prices for an EtherNet card, and you'll see
what i mean. Those cards are beeing sold for nothing on the other platforms
here in Denmark.

HM>
HM> All cleanly written software made use of the extra gfx-modes in an instant.
HM> TT-SCSI was supported by the harddisk-software very soon after release.

Agree. So much for the Scsi devices.

HM>
HM> But I forgot, you only play games. Most of them are badly writtten and highly
HM> machine dependand. You cannot blame this one on the TT, can you? Blame the
HM> authors.

Wrong!. I hardly ever play games.

HM> What do you think you have to update to make use of the Falcon specific
HM> hardware? A recompliation with 68020-flags doesn't improve things. And the
HM> music stuff makes perfect use of the DSP, doesn't it?

What is different from a ST(e) to the Falcon. Just answer this, and you'll
know what i would like to see, when these things are beeing supported. I
know some of them are supported by now, but look at the amount of software
which is supporting these features.

HM> For the reason to make money and stay in the market at all. Where do you live
HM> man? Come back into _real_ life.

I believe i'm here.

HM> You don't understand it as you don not have the insights into the market.

And you don't understand, i got all the insight there is needed to state
what i'm stating. And who are you to tell me about my insights ? I guess
there is alot about me you don't know.

HM> A 486DX2/66 is way faster in raw calculating power than a 68040. And there is
HM> no 66 MHz 68040 at all.

Wrong again. (wasn't you the one telling me to get my facts straight ?)
A 68040 running 33Mhz is running 66Mhz internal! Just like the DX2 machines.
But unlike many Pc's they announce the 68040 with the external clock, not
the internal like the DX2's
And the 68040 33Mhz is just about to available by now.

HM> How much are you willing to pay for 68040 upgrade for a Falcon? Compare this
HM> price to the price of a 68040 MAC.
HM>

Thats another problem i think i'd mention.
When there isn't many Falcon's at the market, the price will be high because
of the low possible sale. Therefore the 68040 upgrade will be high untill
the developers have sold enough. The 68040 itself doesn't cost that much.
So it all depence on the market, which again is depending on the software.
Personally i'm willing to pay between 5-600$ for an 68040 upgrade, and
then my Falcon will be around the same price it would take me to get an
decent 486 or Pentium. But thats still a to high price, i admit.

But i think i've said this lot of times, and you don't really need it once
again. You can't be that stupid.

:
: Phineas

First thing to do is to kill the bloke that gives you a computer, a knife, a bottle and the matches. You can't really do a thing until you have this stuff. Then take a wander up to the FAR top right of the map (walk in map mode, its a lot faster). Once there you will find your crashed space ship which contains a complete medical pack with everything from a cyanide tablet to needle and thread, antiseptic, anti-venom, syringes - the works. Get this THEN when you kill Darwin-5 use the antiseptic dabs on your wounds and remember to keep scanning yourself to see if you get food poisoning and stuff. You can drink the water but boil it first. You can eat the food lying around (cabbages, meat, etc) but remember to take some antiboitics afterwards or you'll get food poisoning.

But still... I can't kill the damn dinosaur on the amazon level - ANYONE?!?!

Hello to all ST owners,
This is to tell you about a new game that is coming out on the ATARI
ST in the next few weeks. Here's what ST-Format had to say about it:-

HOLLYWOOD HUSTLER ST-FORMAT PREVIEW

PRODUCED & DISTRIBUTED
BY DESERT STAR SOFTWARE
MACHINES - ALL ST/STFM/STEs (1 MEG & ABOVE)
PRICE - TBA
RELEASE - MID-FEB

COMING FROM THE NEWLY FORMED DESERT STAR SOFTWARE, HOLLYWOOD
HUSTLER HAS TO BE THE CLOSEST THING TO INTERACTIVE VIDEO
WE'VE SEEN ON THE ST! YOU FOLLOW THE STORY OF A YOUNG
DAVID ESSEX LOOKALIKE, WHO'S ON A QUEST TO RETRIEVE HIS
WAYWARD GIRLFRIEND BY GAMBLING (SO THAT'S HOW IT'S DONE!")

COMPLETE WITH A CAST OF UNSHAVEN ACTORS IN ILL-FITTING
SHIRTS, HUSTLER COMBINES DIGITISED ANIMATION (FILMED ON
LOCATION IN HOLLYWOOD AND HULL ALIKE) WITH SAMPLED SOUND
TO A MORE UPTO-DATE FEEL TO THE GAME.

AT ITS CORE HOLLYWOOD HUSTLER IS A FIVE CARD POKER
GAME (THE FIRST LIVE-ACTION POKER GAME ON ANY FORMAT...
PC INCLUDED)... AND CONTAINS SOME SCENES THAT COULD BE
UNSUITABLE FOR YOUNGER AUDIENCES, BUT WITHOUT BEING AT ALL
OFFENSIVE OR EXPLICIT.... HUSTLER SHOULD BE REARING ITS
HEAD SOON!

FULL REVIEW IN NEXT ISSUE.

Now here's our press release/advert :-

"HUSTLER - THE CLOSEST
THING TO INTERACTIVE
VIDEO WE'VE SEEN ON THE
ST!"
ST FORMAT

"IT'S THE REAL THING!"
MIKE SINGLETON - AUTHOR OF THE
BEST-SELLING 'MIDWINTER' SERIES

THE FIRST FULLY DIGITISED COMMERCIAL
GAME ON THE ATARI ST/STE!

OVER 1 MEG OF INTERACTIVE SAMPLED
SPEECH & FX!

ORIGINAL HOLLYWOOD LOCATIONS

COLOURFUL CAST OF ACTORS WITH FILM
& TV CREDITS THAT INCLUDE
THE ROCKY HORROR PICTURE SHOW..
THE BEIDERBECK AFFAIR..
CONFESSIONS OF A WINDOW CLEANER
ETC.

SPECIALLY DEVELOPED ARTIFICIAL INTELLIGENCE
FOR TOTALLY COMPELLING AND WHOLLY
AUTHENTIC PLAY

ADVENTURE STYLE "CINEMATIC" INTRO, PLUS
THREE INDIVIDUAL ENDINGS

Runs on ANY standard ST/STFM/STE with 1 MEG & above.

Available shortly on Atari ST/STE and Commodore Amiga.
PC and PC-CDROM versions to follow.

> tia, Mike

Not a dumb question at all. You'll need to be root for your
workstation, and run something like a dial-up IP demon (I think
this side of the protocol is included in 'dip'). As far as
I remember, what 'dip' does, is you can create an account on
the SUN with 'diplogin' as the default shell. 'diplogin' will
set some parameters and initiate a (C)SLIP connection over its
terminal line.

The Linux HOWTO's on serial connections and SLIP should explain
this OK.

If I were you, I'd go for one of the other serial ports that can
do higher speeds (38400 for serial 2, 115200 for serial 4).

According to this months ST Format (issue 67) you can subscribe to 'Digital-030' an on-line zine created by yours truly. This is news to me! Heck I wasn't even aware ST Format *had* an email address, let alone send them that email they printed!!! And as for the zine... err well it doesn't actually exist. But they have given me an idea so I might publish the best bits of the disk magazine as a zine, nice one STF :)

Still I'm not complaining, if you'd like to join the real FOG mailing list then just reply to this via email, thanks!

The money was sent via bank, and it's arrival was confirmed.

>>different German dealers, and how to handle situations like the
>>above from abroad. FAX and telephone don't seem to make things
>
>Have you communicated with them via fax or phone lately?

Yes. I also got some help and info from German "netters", and their
participancy did help a lot: they should ship the stuff today,
but still no confirmation of that. Thanks a lot again for your help,
guys! I also got some very good info from mr. Kurtz: if the stuff
is late due unknown reasons, you have to send the dealer a letter
that if the goods are not delivered in two weeks from now on, the
deal would be canceled and the money has to be returned. In this
way (give the copy of the fax to other persons as well, for possible
need of evidence in legal actions) you CAN make it a legal issue,
otherwise you have no case.

>Which means of shipping did you agree upon? Is the stuff already under way?
>There are so many factors to consider here.

The delivery was promised in one week. It's not in it's way yet -
they promised to send a copy of the shipping-form when they get it
posted.

I do not doubt their honesty, but you could demand more
explanations, no matter how techical, about the causes of delay.
Worst thing is that when they say it's coming, and you call a week
later and they tell it's not shipped yet... it gets one really
pissed. And no-one there seems to know nothing about anything (the
person who knows is never there at the moment).

From: "C.J.Davis" <daviscj@ee.port.ac.uk>
Message-ID: <3go6lk$2gn@hawk.ee.port.ac.uk>
Source record: 172229

I have created a program for the St which generates a league file
for use with Kick Off 2.

It creates a league with 8 teams, each having 24 players. Each player
has his/her own set of characteristics which are randomly generated
between set limits. Each player has their skills set for the position
they play in. i.e Defender has low shooting, high tackling where a
forward has high shooting, and low tackling.

I have also designed a program which loads in this new league file
and I am using dialog boxes to display the players attributes. The
program structure is correct but I do not know how to write to the
text field to display the number.

Can anyone help me?

If so, please mail me and I will send you a copy of the program along
with the source code.

P.S. I have also designed a team creator for the Final whistle.

The problem is not that mint only searches c:\mint or c:\multitos, but
that in the minixfs installation instructions it specifically tells you
to put minix.xfs in the *root* directory. This is where the confusion
comes from.

Good question, John. I agree that included .sig's is pretty stupid.

But by the same reasoning, why do YOU insist on a 10 line .sig (counting
blank lines) when the net rules of etiquette suggest a maximum of 4 lines?

Maybe you should check if the drive's jumpers are configured to act as
drive 1 (D1:). If it's not, you can't boot from it. The jumpers can be
reached from the backside of the drive. Both jumpers should be at one
side. I don't remember if it's either left or right.

set up spectre3 for parallel(?)/serial printing
cable to connect epson and atari (probably parallel, right?)
Now you've probably done all this, what you need is epstart, or ultrascript -
printer drivers which gives you better printing capabilities
Epstart- specifically for epson printers
ultrascript- prints postscript files to non-postscript printers, like epsons
maybe someone has one for sale, or knows where to get them

>No. Very few Atari users have an Atari based CD-ROM unit.

In our Suburban Chicago Atarians group, I can count 5 users who have
CD-ROM units on their Atari's. The driver software is available - most
of us use Anodyne's. The group has about 15 or so active members.
Maybe a third is very few in your books - but its significant to me.

Just my observations from SCAT (we still support 8 bit users to so
cover everything from 8 bits to ST* to TT to Falcon and more recently
the Jaguar too.) Wayne

The current version of STalker is 3.04.

: Now, my question.. does anyone know of a way to coax STalker into
: accurately displaying ANSI graphics, or is an upgrade available that
: will solve this problem?

The upgrade files are available for downloading on GEnie. You first have to upgrade to 3.03, then to 3.04. I don't know if this will solve the ANSI problem you are having, but it might.

: Any body had any luck with getting this going.
: Eighty odd pounds seems a lot of money for the commercial program
: Straight Fax.Is it worth it??

I've recently been searching for the same. Only you know if STraight FAX
is worth it for your purposes - but it ain't for mine. Although the
Pagestream driver would be nice!
Anyway...
Hackfax is not on Hensa - I can't find it anywhere!
Rumours of Starcall and Starfax, I am currently investigating.
CoMa is OK, but is 90DM to register, and lacks certain features
Junior Office looks very nice, and well featured, and is only about 10 UKP
to register, but I can't actually get it to FAX yet!

I'll keep experimenting, and let you know how I get on!

BTW: Junior office and CoMa are temporarily available from ftp.brad.ac.uk
in the incoming directory, and should be on Hensa soon.

Cross-posted to: comp.sys.atari.st,fr.comp.sys.atari,rec.games.video.atari

I've got problems with my e-mail. If the guys who wrote me for Super
Bomberman haven't received any answer, I'm sorry, I answered to all of them personnaly.
Here are a list of tips :

1) It is available on ftp.cnam.fr in /pub/Atari/Falcon/Games, name sbm.zip
or ftp.uni-kl.de in /pub3/atari/falcon/games, name sbm.zip

2) If the game doesn't work, boot with <control> pressed down, and retry lauching sbm
3) Try to get the last version
4) Latest version coming soon
5) Please register, I've already got one registration
6) If the game refuses to work, tell me in which conditions, thanks

MB.

I use Stalker version 2 and I get perfect ANSI emulation. I select the ANSI terminal emulation and also use a GDOS font called Big Blue or something and it works fine, well it does in 16 colours at least.

Set your comms program to 19200 and you will connect at 14400 if:

1. You have the HSMODA05 serial port patch or similar
2. The other modem also supports 14400

For a good comms shareware proggy try the best Atari ftp site in the
world:

atari.archive.umich.edu:

and in the Telecomm directory you will find:

connect_2.46_english.lzh 338 v. 2.46 of this excellent comm program
connect_2.46_update.lzh 215 update to fix internal Zmodem bug

Warning don't look around too much or you will never quit!

It is not possible to load TWO GDOS at the same time! Either Speedo
or NVDI - but not both parallel!

BTW - NVDI 3.x also supports Speedo- and TrueType-fonts. But it's much
faster than SpeedoGDOS :)

You can run NOS on both machines and FTP between them.

Alternatively you could put MiNT and MiNT-Net at one end (or both ends) which would also allow you the FTP between them. I've tried NOS->NOS and MN->MN but not mixing them. It should work though as they can both do proper SLIP.

:-)

Standard Atari colour monitors are CGA compatible - so even with a Falcon adaptor you won't be able to use one on on PC in anything other than CGA mode. They won't cope with EGA, VGA and SVGA.

:-(

Roland.

If I remeber correctly, mail to your site bounces. Anyhow, for the record,
here's how to subscribe to the MiNT mailing list:

send mail to mint-request@atari.archive.umich.edu stating that you
want to subscribe. It doesn't matter how you word it, as a human being
will read it.

In a day or two, you shold receive a note that looks something like this:

>You're now subscribed to the mint-mailing list. Send administrativa
>to mint-request@atari.archive.umich.edu and submissions to
>mint@atari.archive.umich.edu. Submissions go directly to the members
>of the list and are not subject to moderation. As we'd like to
>keep it this way, please do not send large binaries or other
>mail-clogging items without warning us first.
>
>Also note that should mail to your address bounce at any time, you may
>be removed from the list without warning. If you don't receive mail
>from the list, please ask us if you've been removed.

If you do not receive such a note, either a) your mail never made it here or
b) we're really busy and haven't added you. If you do not receive a reply
within a week (we shouldn't be that busy), please try us again.

Questions? Send them to me alone or to mint-request at the above address.

Cheers,

NEWS RELEASE 9: THE TORONTO ATARI FEDERATION PRESENTS.....ACE '95!!
******************************************************
EXHIBITORS EXHIBITORS EXHIBITORS EXHIBITORS EXHIBITORS

_/_/_/
```

LLLLLLLLLLLLLLLL chro_Magic!
LLLLLLLLLLLLLLLLL Clear Thinking!
LLLLLLLLLLLLLLLLLL Schauzmoll Software (Orbit BBS formerly
LLLLLLLLLLLLLLLLLLL Oracle - the first GUI BBS for Atari)!

THE LIST IS GETTING LONGER!! More and more Exhibitors are signing on! We're looking forward to CGS Computerbild's presence too, as well as Oregon Research Associates, Anodyne Software, COMPO, Migraph, Lexicor, C-LAB and *many* more!!

===---===---===---===
We're getting a *great* response from User Groups. There are quite a few Groups mobilizing their members into travel
===---===---===---===
packs (packs of Atari users? Look Out!!), and making plans to attend ACE'95. Carloads from Nova Scotia, North
===---===---===---===
Carolina, Alberta, Pennsylvania, Quebec, New York, Ontario, Ohio, Manitoba, Michigan and many more
===---===---===---===
points North, South, East & West. Why not consider car-pooling with some of your own User Group members?
===---===---===---===

ACE'95 is being held in the NORTH YORK CIVIC CENTER, 5110 Yonge St. in Toronto, Canada - April 1-2, 1995. The Exhibition is located in the Civic Center Complex at the MEMORIAL HALL EXHIBITION FACILITY! Show hours are: Saturday April 1 - 9AM-6PM & Sunday April 2 - 9AM-5PM. Tickets are $6 per day at the door (or in advance) & $10 for a Weekend Pass at the door (or in advance). If you place a phone/mail order for tickets, we will have them available for you at the door when you arrive. Please also call us for Hotel reservations at the Novotel (located at the ACE'95 Show Site (in the Civic Center Complex)! We have a large block of rooms set aside just for ACE'95. We can also suggest other hotels/motels in the area!

]]]]]]]]]]]]] American visitors will have unprecedented BUYING
]]]]]]]]]]]]] POWER at ACE'95 .... the US dollar is worth
]]]]]]]]]]]]] nearly $1.40 Canadian! In addition, *EVERYONE*
]]]]]]]]]]]]] exhibiting at ACE'95 will have tremendous SHOW
]]]]]]]]]]]]] SPECIALS ....
]]]]]]]]]]]]] Nearly *ALL* of the Exhibitors have scheduled
]]]]]]]]]]]]] DEMOS of their top products: Calamus lecture by

]]]]]]]]]]]]] more. As well, just about all the

]]]]]]]]]]]]] Exhibitors booths will have RUNNING DEMOS of
]]]]]]]]]]]]] their SOFTWARE AND HARDWARE! As a matter of fact,
]]]]]]]]]]]]] ESQUIMALT DIGITAL LOGIC (OMEN) will have their
]]]]]]]]]]]]] wonderful Multitasking Operating System running
]]]]]]]]]]]]] on an ST (or a Falcon), a PC and a MAC!!

==========
Getting to ACE'95 is *easy*. Toronto is directly
accessed by Highway 401 or the Queen Elizabeth Way,
or Highway 400/69. Crossing the US/Canada border at
Detroit, Buffalo, Niagara Falls, Ft. Erie,
Ogdensburg, Kingston, etc. will lead you directly to
Highway 401 or the Queen Elizabeth Way. Take the
Yonge St. Ramp north off the 401 and drive to 5110
Yonge St. If you take the Queen Elizabeth Way,
follow the signs to get to highway 401. *ANY* AAA
or CAA or other Motor League can provide you with
a map of Ontario, Canada and Toronto. Please call us
if you have any trouble! Pearson International
Airport is only 15 minutes away! Toronto Transit
subway access is direct, too - there's a subway stop

Okay, I haven't actually tried this yet....yet. But are you saying it is
possible to set my ST up as an ftp site, (while the machine is on)?
As this would be a useful feature, as my friend does this on his PC, so I
can download proggies off of his computer; without the bother of uudecoding,
etc.

Thanx...

>with it seem to have 4 chips on 'em. Anyone have any suggestions?
>
>Thanks

I have two different types of 1 meg SIMMS in my STe, two 9 chip
SIMMS and two 3 (yes, 3) chip SIMMs,. and they work absolutely
perfectly. To me, what it sounds like is that not all of your SIMMs
are 1 meg SIMMS. When I installed two 1 meg SIMMs and two 1/2 meg
SIMMs, it thought that there were 4 megs, but when it tried to
actually use them it made for many problems. The way the STe SIMM
banks work is that it looks to see how many slots are filled (only
upgradable by twos, so it checks slots 1 and 3), then it checks to see
what size SIMM is in slot 1, assuming that whatever size of SIMM is
in slot 1 will be in the rest of the filled slots (don't rag on Atari
- all computer types that I know of that determine memory capacity
that way). If it determines that you have 1 meg in 4 slots when
there may be 1 meg in only 1, 2 or 3 slots with the rest of the slots
having less (or possibly even more, like a 4 meg SIMM) memory on the
SIMMs, the system will do crazy things (read: crashing, etc.).
Also, parity does play a part in SIMMs. I believe that if you
have parity enabled, the SIMMs won't work. (No, as far as I know,
there isn't a way to disable parity, but I'm not sure about that).
What I would recommend is for you to take them to someone who can
test the SIMMs separately to test what their actual memory capacity
is, whether parity is enabled, and whether some of the chips are
faulty or not.

Hope this helps,
Leslie

>1. What is the highest screen resolution a standard Falcon can do?
>I heard that it covers all three standard ST resolutions plus 640x480x256 and
>640x480x64k. But does it go above 640x480 with out any extra hardware?

Stock on an RGB monitor, it can do 768x480x64k using overscan
which is internally available.

>2. From what I've seen advertised I can use a VGA or better monitor. To use
>my SC1224 or SM124 I need an adapter. With this adapter I understand I can
>use my older ST monitors on the Falcon, but since this gives them a 15 pin
>VGA plug can I use these monitors on my IBM in standard VGA mode of
>640x480x16 or 640x480x256?

No. There are two monitor plugs, and neither of them will allow
you to use an RGB monitor on a PC.

>3. What is the standard internal hard drive size. I've heard 65 or 80 meg
>is standard. I assume I can put a 500 meg in also if it is small enough.
>IDE is the internal format. Can I put a SCSI in it?

There are no longer hard drives put in from factory, and yes, you
can put in a hard drive up to 540 mb (the limit supplied to me by
someone who knows nothing about the Falcon) if it's a) a 2 1/2"
drive or b) if you have an adaptor to allow you to plug in a
larger size hard drive into the 2 1/2" slot (it's cheaper, but
more of a hassle, and the 2 1/2" drive are meant to take a fall
of 6', meaning that they are higher quality). However, no, you
cannot put a SCSI into the Falcon internally.

>4. I see them advertised at 1, 4, or 14 Meg of RAM. If I get a 1 or 4 Meg
>machine is a RAM upgrade as simple as popping in a standard 72 pin 4 Meg
>SIMM, or do I need some fancy RAM board like on the old ST line? Is 4 Meg
>enough or is like most of todays x86 or MAC machines 8 Meg the real minimum?

If you get a 1 or 4 meg model and want to upgrade to 14 megs
(more than that will require an accelerator or 040 board), you
have three options: a) buy the daughterboard from Atari which is
populated with 16 megs (something happens to the extra two megs),
b) buy the Wizztronics falcon memory upgrade board which takes
one 16 meg SIMM, or c) buy the other falcon memory board (can't
remember who makes it) which allows you to plug four 4 meg SIMMs
in. (To answer a question that's coming up in your mind, no, you
cannot upgrade to 8 then 16 with this or any board.)

>5. I've seen Falcons put in tower cases and a kit called DeskTopper? Are
>these available in the US?

Yes, they are available in the US as well as Canada. You might
want to check with Toad Computers or if nothing else, try Chris
Krowchuk at Computer Direct (c.krowchuk1@genie.geis.com) from
Canada (my dealer)(good guy)(decent prices)(I'm blathering)

>6. I've seen Falcon prices in the UK drop in the last couple of months, what
>about here in the States?

As far as I know, the prices of Falcons are lowering.

>7. Did the Falcon Speed 386 or 486 ever come out? I see the 286 version
>advertised. How does this device plug into the Falcon? Does it use the
>Falcon's RAM or does it require it's own?

The device plugs into the processor direct slot (cool bit inside
the Falcon), and it uses the Falcon's memory.

Hope this helps,
Leslie

I don't suppose you would know why they chose not to support it in the US only.
I was dissapointed before but accepted the fact, but now that I find out it
will live on, but not for me, I really don't like that.
Are they not supporting English versions or just us Americans ??

Very frustrating..............

1529. FZDT and JEKYLL.....

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 07:00:55 UTC
From: VanMil@mindlink.bc.ca
Message-ID: <64169-791708455@mindlink.bc.ca>
Source record: 172226

This, in a nutshell, is how to set up JEKYLL.TTP to run from Freeze Dried Terminal with a minimum of fuss. Other terminal program users can replace the instructions in 5. with whatever they have to do to make a macro themselves to run JEKYLL.TTP This may be a good reason to try Freeze Dried as I can vouch for the fact that it does work great for Jekyll and also does ANSI emulation at line speed. This was setup using Jekyll 1.38 and Freeze Dried 2.20. Should work with other versions of either program although not tested.

1. Put the files called JEKYLL.TTP, HYDE.PRG, and HYDE.RSC in the same folder as Freeze Dried.

2. Run the HYDE.PRG and configure the Jekyll as follows:

On General set the Allow host mode if desired.

Click on Next page and set the Baudrate to the maximum that your system can use. Set the Hand shake to Both if you are using a high speed modem. XON/XOFF is o.k. for anything up to 4800 BPS.

Click on Next page to get to the send and receive section of the setup. Set a drive for send (not critical as it is only a starting point). Set a path for receive to where ever you have room.(This will be the normal default so make sure you really have room on the drive for a lot of files as you can transfer a lot without realizing it.)
Save the JEKYLL.CFG.

On Locked paths set the Drives or Paths that you don't want anyone to access. Save the JEKYLL.LOK.

3. TEST the Jekyll if you want to see how it works. Remember that what you are seeing is both sides of the conversation so don't panic at the double screen typing.

4. Quit the Jekyll TEST with Control Q and EXECUTE the Jekyll. This will put you at the Jekyll title screen.
Press HELP and P to printout the Jekyll commands that you will need to use when in Jekyll. The only commands that you need to remember are the ones after General Keys. Quit the Jekyll with Control Q.

5. Quit the HYDE and run Freeze Dried. Press F4 from the main menu and on a line of your choice type %<path>JEKYLL.TTP% and thats all there is to it.
To run the JEKYLL from Freeze Dried you must be on the terminal

screen and use the Macro Key(set by the line that you typed the
macro on) and you are in JEKYLL. As long as the person you are
talking to is also entering JEKYLL you will be connected for
duplex talk, file transfer and drive access.

ie. the macro line should say something like this
%C:MMS\STALKER\JEKYLL.TTP% or
%F:ZDT\JEKYLL.TTP% or where ever you keep JEKYLL.TTP

1530. MIDI librarian help?

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 07:48:37 UTC
From: ralunsfo@uncc.edu
Message-ID: <3gq2ol$5gi@news.uncc.edu>
Source record: 172227

Could someone explain how, in general MIDI librarians work? I've got an effects processor for my guitar that can be linked via MIDI, which works fine, but the manual does not have *any* useful info on how to back up my patches (though I know it is possible). Also, is there any software I can get that will do this (PD or shareware). I would write my own, but I have no idea how MIDI stuff communicates...any docs or faqs that detail this?

Thanks much,
Russ

PS If it matters, I have a Digitech RP-10 processor

I think it is Atomik 3.5 - a very good packer - if you are going to depack it the use New Depack or Mega depack - I think they will work - or you can use the unpacker built in to Atomik (which you can get from most archives).

1535. Re: Povray V2 on Atari ST?

1537. Re : Championship Manager 1993/94 CHEAT!!!

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 11:26:00 UTC
From: "C.J.Davis" <daviscj@ee.port.ac.uk>
Message-ID: <3gqfg8$sf6@hawk.ee.port.ac.uk>
Source record: 172235

There is a cheat tactic for Championship Manager 1993/94 on the ST.

Here is how to do it :-

1) Select pass-to-feet as your style of play.
2) Select 4-3-3 as your formation.
3) Select your three forwards to centre.
4) Select your three midfielders to centre.
5) Select your centre backs to centre.
6) Select your full backs to left and right respectively and going
forward.

Your tactic should look something like this :-

```
10 9 11

7 6 8

^ ^
| |
3 4 5 2
```

7) Select players to go in appropriate positions.

Now your team should do really well and their averages will be very
high.

1539. Joystick/Mouse extenders HELP!!!

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 11:37:26 UTC
From: "C.J.Davis" <daviscj@ee.port.ac.uk>
Message-ID: <3gqg5m$sf6@hawk.ee.port.ac.uk>
Source record: 172237

I must have gone through about half a dozen joystick extenders.
I have a STe (2Mb), a Zipstick and a 400dpi Golden Image mouse.

The extenders I buy keep breaking after a few hours. It isn't me,
I am a gentle games player. These things must be made of very poor
quality. I have checked my ports, joystick and mouse and they are
all working correctly.

If anyone knows of a decent make of extenders or has made their own
could you please mail me the details.

Much appreciated.

1540. EAGLE

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 11:41:05 UTC
From: <>
Message-ID: <3gqgch$bne@btmplq.god.bel.alcatel.be>
Source record: 172238

At ProTOS the Eagle has been presented to the public by GE Soft:

Processor: Motorola 680xx
or PowerPC
or DEC Alpha
or Intel 486/Pentium
bus system: Eagle Channel
32 bits
with an adaptor eve PCI cards can be used

interfaces:
ACSI
SCSI (4MB/s)
4 serial ports
parallel port
LAN port
VME bus
MIDI
internal ROM port (32 MHz)
external ROM port ST/TT specifications

memory:
max 256 MB TT-RAM
max 14 MB ST-RAM

speed:
Atari TT : 100 %
Eagle 68030 : 250 %
Eagle 68040 : 400-500 %
Eagle 68060 : 700-800 %

currently the Eagle is sold with: Motorola 68030 at 32 MHz
Motorola 68040 at 64 MHz
Motorola 68060 at 64 MHz

1541. IMPORTANT NOTICE ABOUT HENSA ACCESS

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 12:26:12 UTC
From: vctec@westminster.ac.uk
Message-ID: <D3DH7p.6Mw@westminster.ac.uk>
Source record: 172239

Just informing all Atari users out there that gopher and WWW access to
HENSA is now totally restricted to all except ac.uk domain users.

This means that if you are not in the ac.uk domain, then the only
methods of accessing HENSA arre via telnet (for Kermit file transfers),
which is totally unrestricted, and via ftp (which has a restriction of
6 users during working hours, and 10 at other times, for non ac.uk).

The decision to do this was made by the systems manager here, as the
average load on the machine was getting too high for comfort...bringing
everything to a halt. The load was reaching abouve 40.

Hence, when that happened, the systems manager placed the restrictions
straight away.

I would like to thank all of you that support HENSAs Atari section, as
it means a lot to me, and hope that this setback will not have you
looking at other archive sites in preference to HENSA.

Please mail me with your queries...

Regards
Danny

But this isn't all bad news.

you can still access hensa in an unrestricted fashion by going via a mail
relay, for e-mail downloads, via imperial college.

There are also methods of gopher access via a ac.uk relay which I can't
actually remember at the moment but will try to find out.

>The decision to do this was made by the systems manager here, as the

>everything to a halt. The load was reaching abouve 40.
>
>Hence, when that happened, the systems manager placed the restrictions
>straight away.

Boo, but again not totally bad news.

I have news, from a reliable source, that both these access mechanisms
may become available again because the load on the system may be due
to somehitng else. This is all being looked into by the way but there is still
hope. Until then you are limited to the above mechanisms and the 6 ftp
logins during the day (10 at non-working hours) and you can telnet in and
dowload via kermit.

>I would like to thank all of you that support HENSAs Atari section, as
>it means a lot to me, and hope that this setback will not have you

Hope this info can help prevent this in some small fashion.

1544. Re: Anybody have Supradrive 30MB?

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 13:03:11 UTC
From: C.J.Ridd@cs.bham.ac.uk
Message-ID: <3gql6f$aau@percy.cs.bham.ac.uk>
Source record: 172242

James Wood <jamesw@CSOS.ORST.EDU> writes:
>NOW THE POINT: There was a little "Supradrive 30MB" there. It looked
>like a simple plug-in to the DMA port....no host adapter, no interface,
>etc.... Is this hard drive worth anything? DOES ANYBODY KNOW WHAT'S
>INSIDE IT, AND IF IT CAN BE UPGRADED????

They made two versions: both plugged straight into the DMA port, but
one had a SCSI out connector as well, so you could daisychain more
drives.

The mechanism was typically a Seagate ST-157 or thereabouts: OK, but
tended to stick.

I wouldn't touch it unless I was in dire need of a HD - 30Mb is really
small, the drive is very old and hence unreliable, and the Supra
software is very old and may not work on new machines.

```
: Hi ST fans
: Does anyone know if it is possible to add extra icons to Tera Desktop.I so
: are there extra icons in PD?.Thanks in advance.

Yes you can, In fact you can add just about any icon type in atari land
that you like. Icon Juggler is the program you want. It was made by
the Codehead's. I would imagine that it is on umich, it could go by
that name or try MakeIcon. If you have the cover disk from ST FORMAT
July '93 (No.48), it is on that. Otherwise if worst comes to worst,
email me and i will send it to you.

Regards from the land Downunder.

1547. Re: Falcon Questions

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 14:10:19 UTC
From: jdp4@aber.ac.uk
Message-ID: <3gqp4b$n53@osfb.aber.ac.uk>
Source record: 172246

In article <3gk6pp$igq@usenet.INS.CWRU.Edu>, ap748@cleveland.Freenet.Edu (Fred Horvat) writes:
:
:
: Hi,
:
: I have some Falcon specific questions. I never really considered buying
: a Falcon earlier but the more I work on OS/2 based machines with all the fun
: stuff like CD-ROM and true color graphics, my ST with a max of 16 colors
: running at 8mhz is kind of a drag. Multi-TOS help out but at 8mhz it still
: doesn't have the power to do the OS justice. Here are my questions in order
: of importance to me.
:
: 1. What is the highest screen resolution a standard Falcon can do?
: I heard that it covers all three standard ST resolutions plus 640x480x256 and
: 640x480x64k. But does it go above 640x480 with out any extra hardware?

The Falcon can only do 640X400x64k on a RGB monitor - it has a terrible interlace
The highest 64k mode on VGA is 320x480(Unfortunatley). You can get higher
resolutions using a adaptor like screenblaster of blowup - I get 1024x768x16
on my VGA (max is 1280x960 - this uses interlace.).

:
: 2. From what I've seen advertised I can use a VGA or better monitor. To use
: my SC1224 or SM124 I need an adapter. With this adapter I understand I can
: use my older ST monitors on the Falcon, but since this gives them a 15 pin
: VGA plug can I use these monitors on my IBM in standard VGA mode of
: 640x480x16 or 640x480x256?

You need an adaptor for any monitor - they are about £10 each. No you would not
be able to plug a normal RBG into a IBM as it does not give the connection.

:
: 3. What is the standard internal hard drive size. I've heard 65 or 80 meg
: is standard. I assume I can put a 500 meg in also if it is small enough.
: IDE is the internal format. Can I put a SCSI in it?

The smallest is 65meg - I have seen them advertised up to 200meg pre-installed
If the drive is a 3.5inch you should have no problems installing a larger drive.
You cannot put a scsi in it - it does however have a scsi 2 port.

:
: 4. I see them advertised at 1, 4, or 14 Meg of RAM. If I get a 1 or 4 Meg
: machine is a RAM upgrade as simple as popping in a standard 72 pin 4 Meg
: SIMM, or do I need some fancy RAM board like on the old ST line? Is 4 Meg
: enough or is like most of todays x86 or MAC machines 8 Meg the real minimum?

I've got a 4meg and Its fine for all applictaions - more ram is, however, always more prefrable. You need a cheap board to install more ram - only about £20 or so - normal simms can then be installed.

```
:
: 5. I've seen Falcons put in tower cases and a kit called DeskTopper? Are
: these available in the US?

No idea!!!!

:
: 6. I've seen Falcon prices in the UK drop in the last couple of months, what
: about here in the States?

No idea again!!!

:
: 7. Did the Falcon Speed 386 or 486 ever come out? I see the 286 version
: advertised. How does this device plug into the Falcon? Does it use the
: Falcon's RAM or does it require it's own?
:

It plugs into the internal expansion slot - it uses the falcons ram. 386 and
486 versions are supposedly on their way!!

"Live long and Prosper" -

The HipSTer.

> (uh, thirtysomething...)

Depends on what memory-card you have since there are no SIMM-slots on the motherboard. AFAIK most cards for the Falcon only takes 30 pin SIMMs. However, FastRAM-cards (also called "TT-RAM" or "alternate RAM") generally takes 72 pin SIMMs.

> Any reason for the 14meg config, as opposed to 16meg? I think I though I
> could kind of remember reading something years ago that said the last two
> megs were used for memory allocation, or something...

To get a 14MB Falcon you`ll have to put 16MB of memory into it. The two extra megs will just sit there and never be used. ;-(

Why? It`s an easy (and stupid?) way of making old programs run on the Falcon. It`s a legacy from the ST (or actually from the 68000) where the address-space ended at 16M. Atari had to put the memory-mapped registers, the I/O-area, the ROM and the cartridge-space somewhere where the 68000 could read/write and decided to put everything at the end of the address-space.

If you ever plug in a FastRAM-card it will take advantage of the larger address-space of the 68030 and occupy addresses above 16M.

Well, I just received a floppy which I purchased at a local
atari dealer (ACN, Holland, Europe) that also sell's public
domain software, when I start it it says this is V1.4 alpha 05 ,
so I guess it's an o.k. version.

So my question's still stand !

any body out there know ?

The SOFTWARE-version of BlowUp030, can give up to 800x608 in 16 colors non-interlaced. And about 920x700 interlaced in 16 colors.
It just the desktop that doesn`t allow one to choose other resolutions.

My father buyed a DeskTopper from Indigo2 in Denmark. I fitted the Falcon into the DeskTopper for him, it`s VERY easy to "transform" the Falcon into a DeskTopper.

I don`t know if the DeskTopper is avaiable in the US, but I will assume it should be. The DeskTopper comes originally from Germany, but also has support i England. The manual for it is in both english and german.

Al, no one would expect you to know that. But noone needs a crystal ball to speculate that the vast -majority- of Atari users do NOT own a CD-ROM drive. It's great to see new CD titles being offered for the Atari, though, and their very availability will push CD-ROM drive sales.

Source record: 172252

MEGAMIX mixer connects to (up to) 16 inserts on a mixer and uses the ATARI ST to work the faders. The faders in the MEGAMIX unit are the best and quietest around. The unit originally cost (w/software) $2500. I am looking for $475 or best offer. If more information is required, please write. With the cost of some older ST's, this would be perfect for a small recording studio setup. Tyhe files it creates are very small so a hard dreive would not be required. Comes with all cables and documentation. Inredible offer! Hurry!

Has anyone tried MintNet with TIA? (see http://marketplace.com)

Does it even work with MintNet?

How does it help/hamper the performance of MintNet?

The limitations of TIA would keep you from telnet'ing and
ftp'ing to my atari (but not from, thank goodness), but how does it
work for X? (I would guess not so well)

Is it worth the trouble to set it up to use with MintNet? (given my
company does not have true PPP/SLIP access at my site, It may be my
ONLY choice, no matter how good or bad.)

: You still need the TOS fix as most of Atari OS are buged, TOS 1.4 does not
: have support for RTS/CTS flow control, but does if you use one of
: those Fix programs like HSMODA04....

When I used Flash I had a serial-port patch which was able to lock RTS/CTS.
When it was locked flash couldn't disable RTS/CTS.
Think it was called serfix14.prg or something like that.

You may connect this much harddiskspace, but one cannot access more than 1GB
at a time when the drive is connected to the ASCI-bus.

>Using the ICD Desktop acc, up to 32 gigs can be accesed by the system and 64
>gigs with TOS 1.4 and above...

You would need to have partititon sizes of 4GB to do that (with the limit of
16 drives in mind. Or was that 14?). And this is not possible with TOS 1.04.
Purely theoretical, this.

>I wish people woulds stop quoting from old versions of the manual, what we need
>here is real facts, and less of this drivel that I keep seing here...

Said by the drivel-master himself.

>And the 68040 33Mhz is just about to available by now.

Er... begging your pardon but the above is simply NOT true. The 68040 is NOT clock doubled in the same -fashion- as the DX2 machines. That is just Apple (and Motorola) propaganda, my friend. Yes, technically speaking, it does run at a faster clock rate internally but that does not double its performance like you find in a 486DX33 vs 486DX266!

And one more thing... the 68040 33MHz chip has been available for quite awhile as it was used in the Apple Mac Quadra 650 and other machines. And don't forget about the 40MHz 040 in the Quadra 840av honker. Or were you talking specifically about 040-33 Medusa availability? Hard to tell.

Actually that isn't quite true. Atari colour monitors are of a high enough
resolution to do CGA or a bit better; but CGA is a TTL RGB (actually RGBI)
system whereas the atari monitors want an analogue system. A CM8833 or
similar also has a CGA input so that can be used, but not a real atari
one. The most useful use of an unwanted atari monitor is probably with a
video recorder.

The reason I prefer mfsfm is that it forces you to use drive u: which if you've tried to set up a unix like directory structure is very useful.

> It works, but you have to use the internal shell (Mupfel). :-(

BTW, does Gemini let you set up symbolic links if MiNT is installed?

>>: SIMM, or do I need some fancy RAM board like on the old ST line? Is 4 Meg
>>: enough or is like most of todays x86 or MAC machines 8 Meg the real minimum?

For most applications on the Atari, 4M is sufficient. There are some
that can take good advantage of more memory - heavy music, lots of
graphics work, and desk top publishing. Most will run in 4M but 14
may be more comfortable if you want more files/pages etc open.

A 1 meg machine comes with memory on a board. You pop out that board
and can install a different board that has 4M on it or yet a different
board that has 4M simms on it for 16M.

>Speaking of memory, what size SIMM does the Falcon take? Is it 72 pin or
>(uh, thirtysomething...)

My 16M board takes 30 pin - either parity or non-parity (which can
draw less power, generate less heat so is generally the better move.)

>Any reason for the 14meg config, as opposed to 16meg? I think I though I
>could kind of remember reading something years ago that said the last two
>megs were used for memory allocation, or something... And why didn't they
>make it so it could take 8 megs?

Atari uses memory mapped I/O so the upper 2M are reserved for things
like I/O addresses (and maybe the ROM address space.) Hence you loose
the top 2 Megs - until one of the Atari programming elite figures a
way to get around that.

I suspect the driver of all Atari decisions - $$$$$ is why Atari didn't
provide more intermediate memory options. Would you really get 8M?
The upgrade board is in the $125 range plus $100 a pop for used 4M
simms. For 4M more than you have in a 4M machine, would you spend
$325 used or $450-500 new? For 10M more, isn't $525 used/$750 new
a better deal. Wayne

1569. Mega Archive CD v2

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 18:44:06 UTC
From: sjg@phlem.ph.kcl.ac.uk
Message-ID: <1995Feb2.184406@phlem.ph.kcl.ac.uk>
Source record: 172268

Ok guys,

The 2nd (new, improved :-) issue of the Mega Archive CD will be created over the next week or so. As before, I'm going to grab most of a.a.u.e but this time, I'll have Linux/X11, as well as all the updates and new programs since last time. I'm also going to raid HENSA - Danny expect that load to rise :-)

As some of you may know, we ran into trouble last time, with some of the files at aaue being more `dodgy' than UK law allows. If anyone knows of anything on version 1 they *think* may contravene any law anywhere, please let me know. I don't want to have to go through all that again :-(

If anyone has stuff they want put onto the disk (demos etc. that aren't publically available) then get in touch, and I'll see what I can do. Scorpions - are you listening :-))

The main point of this post is to ask if anyone knows the FILES.BBS format - I gather it's a file in each directory that lists the contents but I'm not sure what format it's in.

[oh - if you bought vol 1 from Karl, I'm pretty sure there'll be a cheap upgrade fee (1/2 price) if you send the CD back to SysSols]

ATB,
Simon.

Source record: 172273

Phillip Davey (Path) (pd@mole.bio.cam.ac.uk) wrote:
: OK. I have finally managed to make a minix partition on my disk.

: When I used the configuration program to check it, it said the four
: options (directory, execution etc) where TOS domain. At that time it
: wouldn't use long names.
: So, I used this program to change everything to Mint domain. Now it works
: really well. *Except* that whenever I reboot, it changes back to TOS
: domain, which means I have to change it back everytime I switch on the
: machine, which is a major pain!

Execute the configuration program from your MINT.CFN file using:

EXEC mfsconf [...whatever you put when you run from the shell...]

I think there is an example of this in the sample MINT.CFN distributed
with the MiNT 1.12 binaries. Also look in the mfsconf doc distributed
with the minixfs sources.

Be warned though.... One of these has the drive specified after the
parameters when it should be before and the other has an incorrect
parameter ('-l' I think).

From: thopman@uoguelph.ca
Message-ID: <3grfs3$jmi@ccshst05.cs.uoguelph.ca>
Source record: 172274

I'm having something of a problem with my Mega 4 (T25 accelerator, JRI 68881 FPU upgrade, 1.44 meg floppy upgrade, 4096C board). What happens is that after a varying period of use (usually longer than 30 minutes after I first switch the machine on) the machine resets itself and continues resetting itself until I: a) let it cool down or b) pop the case and reseat the 4096C board. Neither is a very palatable solution, and I would like to get the problem fixed. The question is, how do I do this?

I'm told that bad connections on the power supply may cause the problem described above, but I took a look at it, and there was no obvious break in the solder. I suppose it is possible that this is the problem, and that reseating the 4096C board (which is right next to the PS) re-stresses the power supply board and makes that connection again.

I personally think that the 4096C board is causing the problem. The machine sometimes seems to work better when the board is sitting just lightly in the blitter socket. I cleaned off the pins of the board, but it didn't seem to help much. I suppose I might try permanently removing the board and replacing the blitter in its original socket, but it seems kind of an extreme step, and one I don't really want to take if there's another solution available.

Any suggestions?

Thanks...

THeo

1574. Re: GEnie to close down...???

Newsgroup: comp.sys.atari.st
Date: 1995-02-02 20:55:45 UTC
From: bobbro@delphi.com
Message-ID: <hgw6rAB.bobbro@delphi.com>
Source record: 172275

I find it interesting that Roger felt that GEnie was the network in question. GEnie is still profitable, although they have a well established pattern of using distributors to handle their overseas services, rather than just doing themselves. Because of their affinity for distributors the news of them selling off their NZ business is no big deal (IMHO).

After all, with all due respect to the Kiwis, we're talking about a nation that is all of what, 3 million people. Less than the population of the City of Los Angeles, and no where near as convenient.

If I were to hazard a guess, I would suspect Prodigy. I'm not sure what their subscription numbers are, but I would not be surprised to hear that Louie Gastner of IBM is getting tired of pouring cash into a sinkhole that hasn't turned a profit yet.

Again, strictly speculation on others speculation.

And Hutch's comments re STR are pretty much mine as well.

regards to all,

Bob Brodie

>
> Are there any old-timers out there who used to use Uniterm????

I occasionally use it, and it is still my first recommendation for users of 8mHz 68000 Atari computers for UNIX telecommunications. The only thing it really lacks (IMHO) is Zmodem support, and this can be added easily through the use of some macro files and an external Zmodem (I recommend GEM RZSZ 2.28, available on atari.archive.umich.edu).

It can be a bit complicated to set up initially, but text speed and perfect vt100 emulation are worth it.

> Uniterm was mah-vel-ous. It even offered SMOOTH scrolling!!! I don't
> know of any other terminal program that can do that.

I never thought smooth scrolling was very useful, but to each his own :-).

> What happened to Uniterm, and the author, Simon Poole?

I have lost track of Simon, but the last version of Uniterm is 2.0e015, and is only available on chsun.chuug.ch in software/atari/UniTerm. Simon has asked that this final version not be uploaded to any other ftp sites. The latest one available from general sources is 2.0e011.

I have a 520STM for sale, including a SF354 floppy disk drive, mouse, two joysticks, and all power supplies and cables. No upgrades, and no monitor. Built-in RF modulator for hooking up to a television. All original manuals and most important boxes are included. Asking $50, but best offer gets it. Buyer pays shipping. E-mail me.

I don't see why not. I'm not sure about the modem side and the security
issues - but an Atari running NOS or MiNT-Net looks *very* much like an FTP
site to another machine logging in. MiNT-net would almost certainly be
better as it is much more flexible.

:-)

I have several games for sale. I have divided them into three lots, with
suggested prices, as follows:

Arcade games, $20 together.

- Blood Fever
- Frostbyte
- Seconds Out (boxing)
- ST Karate (kick-boxing)
- Test Drive (race driving simulation)
- Time Bandit
- TV Sports Football
- Winter Olympiad (Winter Olympics)

Strategy games, $15 together.

- Alternate Reality
- Balance of Power
- Brataccas
- Breach
- Empire: Wargame of the Century
- Exodus: Ultimate III
- Ogre
- Roadwar 2000
- Shadowgate
- Sundog, Frozen Legacy
- Temple of Asphai Trilogy

Adventure games and simulations, $15 together.

- Bureaucracy
- Flight Simulator II
- Gato
- Little Computer People
- The Pawn
- Sim City
- Transylvania

Lots are sold as one. All original manuals and boxes are included. Prices
are negotiable; best offer takes each lot. Buyer pays shipping. E-mail me.

1584. AstroPanic94! rev. D

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 01:25:43 UTC
From: baldrick@terminator.rs.itd.umich.edu
Message-ID: <3gs0mn$e3c@lastactionhero.rs.itd.umich.edu>
Source record: 172285

AstroPanic94! rev. D. is now available at atari.archive.umich.edu
under Games/Space/p94_revd.zip and ftp.cnam.fr under
Atari/Games/p94_revd.zip. Sounds are available at the same sites under
the name original.zip.

I have now added support for sound on ST's without DMA sound. I
also cleaned up the Sound driver for DMA sound and it now supports Stereo
sound as well as 16bit (Falcon only), while doing that I think I fixed
the problems with the sound on the STe (probably TT aswell).

I also fixed a small problem in the colision detection that
allowed you to shoot throgh ufo's near the bottom of the screen. And
re did the timing a litle so it runs at a more standard pace on 8mhz
machines. And fixed a path variable that was too short.

So hopefully I have most of the bugs worked out. If you have
problems running rev. D, try changing the location of it's directory. On
my falcon it doesn't matter where it is, on my STe (TOS 1.62) the sounds
get corrupted if it's buried too deeply in other folders.

And again for those of you who don't know, AstroPanic 94! is a
small blast-em-up that runs in any resolution and (2,4,16,256) color modes.
It's mouse driven and now supports sound on all Atari TOS compatible
machines. With extensive DMA sound support. ;) Registration is only $5,
if you wish the registered version transfered electronically. In the
registered version you get two new UFO types, Laser Sattelites and Bonus
Ships. So if you haven't tried it yet, or tried it once and had no luck
running it, Please try it again. Enjoy.

**** New ****

European Users can now register through Holland Game Designs.
For details see the readme.txt file in the archive.

As alway send bug reports, comments or suggestions.

Title says it all. I bought the game close out with no returns
and the disks were bad. Anybody out there willing to part with their's
or willing to copy their disks for me (I can photo copy the original
disks as proof). I've contacted Gremlin and they said that they no longer
stock the game because it is over 2 years old, that I'm on my own on how
I get a replacement. The game had the warranty card since it was new but
since Gremlin no longer stocks the game it's worthless. I can send 3 floppies
and return postage no problem and a little extra for the effort.

Thanks

Message-ID: <791779302snz@bassland.demon.co.uk>
Source record: 172288

After a recent news-posting about "What files do I need to use MiNT-net,
instead of NOS", I have this to say......

Okay; so, I've downloaded mint112b.zoo, I've got it installed, and it works.
I've even downloaded wintos14, and that works too. (Because I wanted to 'see'
some multitasking on my ST).
I was also told to get net-060.tgz, which I did, I un-gzip'ed it, and un-tar'ed
it....but all I've got is a load of 'c' files (and many other files too):

Q. 1. Do I have to compile any of these?

Secondly, I've also got mfs610b.zoo, which I've un-zoo'ed, and I have several
ttp executables.....

Q. 2a. I've cleared out my G:\ partition....."What Now?"
Q. 2b. How do I set up G:\ as a minix partition?
Q. 2c. What other files do I need to use it?
Q. 2d. How do I use it?

Q. 3. Do I need (or have any advantage) in getting lynx?

I've seen lynx, it's about 200Kb+ so I'm not going to download for the sheer
hell of it.....I'm on dial-up remember :(

? "Wouldn't it be nice if at least one person actually sat down and wrote a
complete guide, to setting up MiNT/Minix/Lynx, etc" - I know I'm not the
only person who needs to know.

Matt McAlister <Matt.McAlister@dataport.com> writes:

>I thought that Michtron went out of business? I tried calling there bbs # and
>voice # and got a wrong number both times. If they are planning an upgrade,
>I'll be one of the first to buy one. I'm running a mbbs myself and am anxious
>to make use of my hi speed modem.

MichTron was sold a few years ago, but maintained the name. The MichTron
support BBS (Griffin BBS) went down shortly afterward. The new outfit,
if still around, is in Delaware, I believe.

MichTron is not putting out the upgrade - this is purely a Tim Purves
effort. Tim maintained the rights to the program. I'd just wish that
he'd let us know what the status is for the upgrade!!

Where are you located, and how long have you been running MBBS?

There are two upgrades past that, to 3.04. As for displaying
ANSI graphics properly, install GDOS with the .FNT files.

1593. Supra Internal Megadrive Question

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 04:51:02 UTC
From: sxp17@po.CWRU.Edu
Message-ID: <3gscnm$emg@usenet.INS.CWRU.Edu>
Source record: 172294

Hi- I just bought a used Supra Mega internal hard drive kit for my Mega 4.

It came without the drive- just the internal host adapter. Does anyone know what kind of drives I can use with it? I would like to use a 105MB Quantum SCSI, but I read in STart (1989) that this originally came with a 30MB RLL drive . . .

Also, I have an SLM804 Laser printer . . . The STart article says that it can be used with an external cord that hooks to the DMA connector of the SLMC box of the laser. Toad Computers says that this can't be done . . .

Any help would be greatly appreciated . . .

Thanx!

1595. Eastern Iowa Computer Fair

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 06:02:52 UTC
From: leland@ins.infonet.net
Message-ID: <3gsguc$rmv@insosf1.infonet.net>
Source record: 172159
Cross-posted to: comp.sys.amiga.misc,comp.sys.apple2.marketplace,comp.sys.apple2.usergroups,comp.sys.atari.st,comp.sys.ibm.pc.misc,comp.sys.mac.misc,comp.sys.sinclair,comp.sys.tandy,comp.sys.ti

On Saturday March 4, 1995 the Commo-Hawk Computer Users Group of Cedar Rapids, Iowa will hold our 12th annual Eastern Iowa Computer Fair.

This year the fair will include displays by computer user groups, retailers of computers and computer accessories, retailers of computer software, shareware distributors, and much more.

There will be hourly door prizes given away in addition to the GRAND PRIZE, which is a LASER PRINTER. You don't need to be present during the grand prize drawing to win the laser printer.

The following is information for the fair:

Saturday March 4th from 8:00 AM - 6:00 PM
Teamsters Hall, 5000 J Street SW, Cedar Rapids, Iowa

Everyone older than 14 years will be asked for a strictly voluntary donation of $2 at the door.

If you've been to our fair in past years, it is at a new larger location this year.

The following are directions for how to get to the fair.

- Take I-380 to exit 17 (33rd Ave SW in Cedar Rapids).
- Go East on 33rd Ave to "J" Street (the first stop sign).
- Go South (right) on "J" Street to 50th Ave.
- The Teamsters Union Hall will be on the West (right) side of the street.

Also, if you want me to e-mail you a PostScript file containting our fair poster (it includes a map), send me e-mail asking for it.

You can get more information in any of the following ways.

e-mail: leland@ins.infonet.net (any time)
Fax: 319-393-4852 (any time)
Tel: 319-393-4631 (Leland, please before 10:30 PM central time)
Tel: 319-366-2347 (Linda, please before 10:00 PM central time)

Hope to see you at the fair. :-)

Just get a program like Make1MB. Just run one of this programs and your computer thinks he has only 1 MB. F29 should then works fine.

Sacha.

I don't know about yours, but my sysadmins get real pissed off if you use
TIA around here because of the high loads it places on a system. I would
ask around before you use it.

From: vctec@westminster.ac.uk
Message-ID: <D3F3BJ.7MI@westminster.ac.uk>
Source record: 172151

Hi all

I am going to pick up a SCSI mechanism today, which I will chain onto my existing one...I have enough room in my mini disk enclosure tower. :-)

Question is, do I need to do anything aprt from just plug it on? Also, what about formatting and partitioning the drive?

Do I have to reformat and partition my existing drive too, or will the software see these as two different physical drives, allowing me to format one and not the other...?

I am using ICD software BTW...maybe I'll buy HDD...but for now, ICD is fine.

Regards
Danny

> [...]
> 1. Is the system recoverable?

Probably.

> 2. What is the problem with the Link2?

The problem may not be with the Link2 at all. While swapping HD's around it is perfectly possible, even likely, that you may have induced a static discharge into the DMA port and killed the DMA-controller (thus boot-up bombs). I've seen this happen, usually because the swap is done without powering down. The damage can both be temporary (the DMA chip later "self-heals" by losing the charge which has blocked something?) or permanent (chip replacement required).

>also there is no shell with the program.So its not easy to work
>out how it all comes together.
>Any body had any luck with getting this going.
>Eighty odd pounds seems a lot of money for the commercial program
>Straight Fax.Is it worth it??
>Oh by the way Im using a 1040 STE and 20mg Hard drive with Colour mon.

From what I have seen of Straight Fax, I would prefer COMA 260, thier is a Demo (Crippleware) on most sites, I have been told that version 260 is now in English and German, but I think that will even cost you 100DM ane more if you need the manual...

But at least you can test it, you can't test Straight Fax...

I had a play with a early version of COMA, and I liked it, but not for 100DM, at 50DM I would buy it....

This is one of the BIG problems I find with German software, its far to dear....

No Claus, this is often refered to as a Disk Format, that will load
faster, they have a bad sector at the end of the track...

Its like the Dave Smalls Twist format, give you a faster load,but all
sectors start the same, not like Twist...

>only two worked on my Atari, all four worked on my friend's Mac. Oi.

You could have a damaged Simm sockets, or a faulty MMU chip or what is used on the STE...

Atari only test the machine with the Ram that is fitted..

I have a STE that will not Run the STARDUST Demo plus thier other demo ?,
all caused by a faulty chip, all other software runs with this faulty chip,
this is the Large PLC one...

THe ninth bit is not connected on the STE's, but it should be dissable,
(inputs connected to 0v or 5v) as the SIMMs could draw to much current...

1611. Atari files read by Amiga/PC?

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 11:49:22 UTC
From: hhijg@alfred.uib.no
Message-ID: <3gt582$aa1@due.uninett.no>
Source record: 172160

Help me! I am looking for a utility that reads Atari files and writes them to an Amiga/PC. Please help me!!

Yours, Jostein!

1612. MiNT/Minix/GCC - Please help me!!!!

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 12:18:29 UTC
From: ceebsm@cscd4c3.caledonia.hw.ac.uk
Message-ID: <D3FBIu.rz@cee.hw.ac.uk>
Source record: 172161

Ok, please could anyone E-mail me (the news at my uni expires too fast)
and let me know how to solve the following probelms:

1. My minix partition allows me to save long file names correctly,
but when I try to extract .zoo and .tar files with longnames
in them where the first 8 characters of the filename are the same
then the extractor skips the file!!! For example extracting the
X11 include files leads to about 5 files being skipped by zoo.
(The files causing the problem are called <bigname>.h and
<bigname>P.h).

If I create files called <bigname>.h and <bigname>P.h from csh
then there are no problems...this is driving me nuts!!!

2. What version of gcc should I _TRY_ to install? Version 2.22 from
the MiNT Distribution Kit works fine. But I would like version 2.61
instead so I try installing the .ttp files from it over the older
version I get errors along the line of: __MAIN.o referenced from text
I have tried installing version 2.58 too but the same errors appear.
I have set up the paths for the include and lib directories
correctly with the latest versions of mintlib/inc and have my folders
set up as MiNTos recommends too.

By the way my system is a 4Meg STE with a 30Mb+ partition (will be bigger
once I get this system working correctly). If you can help me in _any_
way please do....before I go mad and buy a pc!

Barry

- to find the numbered address of the FTP site, use the following command,
while inside FTP: ftp> !host FTP-address [CR] i.e. "!host cs.bu.edu"

DOWNLOADING FILES, Instructions: [CR]= carriage return/return/enter
----
1) Go to the directory where you want the files to be downloaded.
2) ftp [CR].
3) open {ftp address} [CR]. i.e. "open ftp.uni-kl.de" [CR]
OR use the (IP) number address, NOT both!
4) "Name": anonymous [CR].
5) "Password": {full e-mail name/address}. i.e. "hallvart@ifi.uio.no" [CR]
6) use "cd" to access the appropriate directory. i.e. "cd pub/atari" [CR]
7) bin [CR]. (set `binary` transfer mode)
8) hash [CR]. (shows 'hash` signs (#####...) when transferring data)
9) get {filename} [CR]. i.e. "get rename.lzh" [CR]
10) mget [CR] to get several files at once.
i.e. "mget syst12.Z fixdsk.arc icon4.zip" [CR]
11) prompt [CR] to download several files with "mget" without having
to reply "y" for each file when asked "get {filename}?".
12) quit [CR] to end FTP session and go back to UNIX
13) close [CR] to close the FTP site you're currently on, so that another
site can be opened without having to set bin, hash, prompt etc. again.

- bin, hash, prompt will be turned on/off each time it's typed!
- Be sure to check if all modes are set correctly (especially 'bin')!
- stat [CR] or; status [CR] will show all modes and where you are connected.
- Most files are compressed. Use an appropriate program on your computer on
which the programs were intended, or in UNIX ....

- uncompress [CR] if ".Z" file
- uudecode [CR] if ".uu" file
- very often, files are still compressed in another format after uncompressing .Z and/or .uu.
Use the appropriate decompression program for this.

- ls [CR] lists files (shows all files in current directory).
- pwd [CR] shows path. i.e. /pub/mirrors/umich/atari/utilities
- If down-loading several files with similar names use "*".
i.e. "mget *sys" [CR] (will get f.x.; datasys, lm23isys, xlinksys etc...) (ALL files with "sys" in their names)
i.e. "mget *.lzh" [CR] (will get f.x.; stest.lzh, dw3.lzh, xlba.lzh etc...) (ALL files ending with ".lzh")
i.e. "mget * [CR] (will get ALL files in the current directory!)
- If your computer doesn't have a disk drive you can "remote login" to another computer (use an other terminal's disk drive);
- rlogin {computer name} [CR]. i.e. "rlogin hnoss" [CR].
- You can now access the disk just as if it was on your own machine.
- eject [CR] to eject disk on disk-drives without "eject button"

TRANSFERRING FILES TO MS-DOS DISKS

Part of this is dependent on you having the GNU msdos-utilities available at your site. If you don't, ask your local system operator how to transfer files to/from MSDOS disks.

- mcopy {filename} a: [CR] i.e. mcopy microtcx.zoo a:
i.e. mcopy microtcx.zoo icone.lzh shblr.arc a:

- mdir [CR] to show disk-directory/space left.

- fdformat -d [CR] to format an MS-DOS 3.5" 1.44mMb disk ("-d" for MS-DOS)

- fdformat -l -d [CR] to format an MS-DOS 720Kb 3.5" disk ("-l" for "low density")

- mcopy a:{filename on disk} {copy filename} [CR] to get a file from disk to computer. i.e. "mcopy a:dlist.txt test1.zip"

- mdel a:{filename} [CR] to delete a file on disk. i.e. "mdel a:dslist.txt".

- eject [CR] to eject disks from disk-drives that don't have "eject buttons".

- -

1625. wanted: programme to expand atari .zip files

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 16:20:29 UTC
From: asterbz@PROBLEM_WITH_INEWS_DOMAIN_FILE
Message-ID: <3gtl4d$jc7@balu.kfunigraz.ac.at>
Source record: 172176

Hi folks!
Is there anybody out there who knows where I can get a programm which can
expand atari st .zip files. The problem is that this programme should not
be an atari .zip file (programmes which can be expanded with the help of
ms-dos are o.k.)

If you know ftp sites where I can find such stuff or if you even have got such
a programme mail to asterbz@gewi.kfunigraz.ac.at.

I'd be ever so greatful....

>2.5" IDE is the standard _internal_ size. Atari used to ship with 65meg
>You can't put a SCSI _in_ your Falcon I don't think. But you can

You can install SCSI-drives _internally_ into the Falcon. The cable requires
some fiddling, but it is possible.

One can also fit an 3.5" drive internally. This will require some
modifications, e. g. removing of the internal screamer, err make that speaker,
but it can be done.

>HTML readers, but I've just had a thought.

Nicely put. But are those folks really working on it?

> How about an HTML to 1st Word Plus format converter? I've thought

A converter sounds fine. But why in the world to WP-forat? That doesn't make sense to me at all. I'd rather have a HTML-2-ST-Guide converter. That would have much more sense, IMHO. Both being hypertext and somewhat of a standard.

>about it, and it's totally workable. Before embarking on the project,
>I'm just wondering if anyone would have a use for it? Is this something
>people would like? Have you got any other ideas?

Definetely useable, most definetely appreciated,

> Oh, and would anyone send me HTML files that they think are within
>the HTML standard, yet still a tad weird. You know what I mean...

I have some textfiles re. HTML which I can mail out to you, if you want. One can request HTML-pages from certain servers.

Send mail to

listserv@www0.cern.ch

leave the subject line free, and in the body of the mail put

send http:// ...

There is another service for this:

webmail@curia.ucc.ie

but I do not have the syntax handy for this one. It is slightly differernt from the first one. A message with HELP should work, though.

Hello people,

I'm looking for source code to format floppy disks of any format. If you
have some source code in pasca, modula2, c or c++ then tell me please.
Or if you know where I can get some information tell me, too

Thanks

R. Staub

>> When you read a zero, have you tried reading the next character. In some
>> languages (I think C is one) zero can be used to denote 'special character'.
>> I don't know what you will find, but it is worth a try.

I think this could be right - I remember doing my A-Levl project in HiSoft
BASIC It took me ages to work out how to read the arrow keys - if I remember
correcly INKEY$ gave a two-character string if you pressed one of the
non-ASCII keys, the first character being blank (must have been either a space
or a chr(0)) and the second one being some letter......

If you like, I'll dig out my listing and see if I can find out exactly the way
I did it....

In article <3grog4$8r2@hasle.oslonett.no> hallvart@oslonett.no (Hallvard Tangeraas) writes:
>Is there an Atari St version around for the "TIA" (The Internet Adaptor)?
>I know that people with Macs and PCs can access my net provider
>graphically (like with Mosaic) by using it.
>I would like to be able to do that with my STE.

I don't know of one. You can get a proper SLIP,CSLIP or PPP connection, which is better if your provider offers it, but not TIA. Having TIA wouldn't give you graphical access anyway, you'd need to also have a graphical web browser which doesn't exist at all for the atari.

>
> But still... I can't kill the damn dinosaur on the amazon level - ANYONE?!?!
>

You'll need the distress pistol. The dinosaur can't stand the light, so it hunts only at night. After you fired the distress pistol (use the USE-Icon, not the Weapon-Icon) the dinosaur is paralyzed (after a few seconds) because of the bright sky. Now it is easy to kill the dinosaur.

Bye

Are you talking about MinTos or about this accessory which allows you
to start Tos-programs in in window ??

>I was also told to get net-060.tgz, which I did, I un-gzip'ed it, and un-tar'ed
>it....but all I've got is a load of 'c' files (and many other files too):
>
>Q. 1. Do I have to compile any of these?

You don't. There are executables in the archive, which you won't
recognize immediately. There is a dir called net (or something like
that), in which there is a file called socket.xdd, and a dir called
drivers where you can find some drivers. copy the socket.xdd and the
drivers you need (slip, plip, dummy .xif (where dummy is a fake driver
for testing purposes)) in a dir 'mint' or 'multitos' on your
boot-partition. They will be loaded automatically when booting.
Also, there are some handy tools in a dir called tools (or utils ??).
what you will need, are slattach, ifconfig, traceroute. (Don't know at
the moment what else you can find there.)

>
>Secondly, I've also got mfs610b.zoo, which I've un-zoo'ed, and I have several
>ttp executables.....
>
>Q. 2a. I've cleared out my G:\ partition....."What Now?"

There is a tool called minit in the minixfs-package. Just do
minit -P -V -n2 g:
which will set up partition g: as a minixfs with long
filenames, which you will probably need for mint to work alright.

>Q. 2b. How do I set up G:\ as a minix partition?
>Q. 2c. What other files do I need to use it?

The most important thing is the driver minixfs.xfs included in the
package. You must copy it to the dir mint or multitos mentioned above.

>Q. 2d. How do I use it?

Well, you won't have any advantage of minixfs when using it with
normal GEM. There are three ways of working with it:

1. Use Gemini 1.9999e. This can (amongst others, as I should say)
display long filenames in normal windows. You won't notice much of
a multitasking with this, though.

2. Get a mint-aware shell like bash or tcsh in a new version. This is
in fact much better to work with, but you will also need fileutils
like ls and so on and you should be at least a bit experienced in
unix to cope with it all.

>
>Q. 3. Do I need (or have any advantage) in getting lynx?
>
>I've seen lynx, it's about 200Kb+ so I'm not going to download for the sheer
>hell of it......I'm on dial-up remember :(
>
Well, just to say it, lynx has nothing to do with mint itself, or with
minixfs. Lynx is a terminal-based www-browser like mosaic or netscape
on other machines. It's quite nice and, last but not least, the only
program available on the ST for www. (In fact it's the only I've
gotten hold of, and of which I know it's good and supported
continuously.)

>? "Wouldn't it be nice if at least one person actually sat down and wrote a
>complete guide, to setting up MiNT/Minix/Lynx, etc" - I know I'm not the
>only person who needs to know.

Well, as I'm always lokking for things to do, I would perhaps do
something like that. But I think there are several others dealing with
the stuff already. I don't really know for sure, what is done at the
moment. So, if someone has information about what's going on with mint
documentation and stuff, please let me know.

Oliver

I haven't actually *done* this, but the following should work in theory:

Copy the zip files to a PC format floppy (make sure it's 720k DD, not HD)
using Apple File Exchange or equivalent software. The ST should read the
floppy OK, and you can unzip them on the ST using STZIP.

Hope this works and solves your problem!

John

>RevDrFreak

Simplicity itself :^)
format some disks on the atari as dos disks(9 sector-80track-dos sector)as in
DCformat or others. I am assuming you have some way of reading PC disks on the
MAC? MAC has the capability, included with their systems disks, but there
are 3rd party programs that will also do it- just goto ftp.apple.com, or any
apple ftp site. if so just copy the files onto your PCformatted atari disks!

>
>Hallvard, Oslo, Norway

My understanding of TIA is that it runs on your Unix login session to provide simulated SLIP/PPP connections. There is nothing special from the package to run on your ST.

What you do need is something that understands the SLIP connection like Mintnet or NET. You cannot do any services like PING, but you can FTP, Lynx, and Telnet out from your system. You cannot do those services FROM the net to your ST, however, since your ST will not have a real internet address.

And, as stated in another post, there are no graphical WWW browsers for the ST. Only Lynx which is Text.

See http://marketplace.com for more information.

I am trying to get an evaluation copy, but I can't seem to get their mailbot to send me the forms...

I need help...

I dug my 1040STf out of my closet a few days ago and the ICD scsi card and set up the system... This my sound dumb so try not to laugh to hard at me(grin)

One problem I ran into was I figured out how to install 2 scsi drives on the ICD but can't seem to get the Supra 20mb drive to work through the ICD card?

also it appears that I have tos 1.04 or later for I can set up the partitions to 32mb and my gem decktop recognizes them as 32 mb? is there a way to check what version of TOS I have?

I have the boot disk for the supra and it has stuff on it I don't wish do erase, but I will if I have to...
Also I can't find any of my books!!! the one's for the computer or the drive or anything(ahhhhh) so the only place I can turn for help is here...

I was also wondering if there is a way to get more Memory for the 1040STf? (my subject line)... I opened it up to clean it out and it appeared that the memory was soldered to the board? is there an upgrade card or can I replace the drams with other drams? This is my big problem...

1638. printer redirection

Newsgroup: comp.sys.atari.st
Date: 1995-02-03 18:55:50 UTC
From: macdonald@cfcsc.dnd.ca
Message-ID: <macdonald.130.000DEEA7@cfcsc.dnd.ca>
Source record: 172188

Bonjour!
I have an Atari SLM804 laser printer, hooked up (of course!) through my DMA port. Now, the problem I am having is that when I go to print from something like NeoDesk or Edith Pro I can't! simple, eh?! Is there anything out there in terms of programs, fixes, etc that would allow me to redirect output from the parallel to DMA? This problem happens whether or not SpeedoGDOS is loaded, which surprises me as I would have thought GDOS would have redirected output itself. But I guess prg like EdithPro and NeoDesk ignore GDOS. Any help would be appreciated.
thanks/merci

PB> should I use to produce a disk with the TOS format (I also
PB> can use a PC) ?

Just use the msdos format, as the ST as flexible enough to read it. I'm not sure if the UNIX machine will read 720k msdos disks, but if it does you can use your disks directly.

So what is the deal? Are they making packages of any 10? How do I
order mine?

These are not too bad IMHO:

ADICTABALL (classic breakout)
ARKANOID (classic breakout)
BACKLASH (simple shoot-em-uper)
BUBBLE GHOST (4kids,tricky)
CHOPPER-X (shoot-em-up)
CRACKED (4kids)
F-15 STRIKE EAGLE (basic flight sim shooter)
FLIGHT SIMULATOR II (*good flight sim)
GUILD OF THIEVES (adventure)
IKARI WARRIORS (fighter)
MERCS (blast-em-uper)
MOUSE TRAP (4kids)
OUT RUN (car racer)
PANDORA (er what do you call these?)
RVF HONDA (motor bike racer)
SENTRY (THE) (never did figure this one out)
STAR GLIDER II (*good spaceship sim shooter)
STUNT CAR RACER (*good car racer)
TEST DRIVE (car simulation)

These I have heard are good:

CARRIER COMMAND
FORMULA ONE GRAND PRIX
MIDWINTER
PIRATES
or was it PIRATES OF THE BARBARY COAST?
SILENT SERVICE

] >with the first 4 characters as: ATM5?
]
] I think it is Atomik 3.5 - a very good packer - if you are going to depack
] the use New Depack or Mega depack - I think they will work - or you can use
] the unpacker built in to Atomik (which you can get from most archives).

Atomik hasn't been terribly reliable in my experience, half the programs
I pack with it cease to operate, whereas Ice-pack v2.4 and PFX-Pack v2.1
both work fine. Ice-Pack is quite quick, and gets good compression,
PFX-Pack is very quick and still gets good compression, although not
quite as good as Ice. (Ice must do more passes or something)

C-Lab doesn't have the engineering manpower and skills to do this in the
firstplace. The Falcon MkII will basically be a standard, off the shelve
machine with the commonly know pathes for the sound-subsystem installed. And
it possibly comes with an internal SCSI-HDD.

That's it folks :)

> Q. 1. Do I have to compile any of these?

No, you need to put net\sockdev.xdd, net\drivers*.xif (I think) in your
mint folder, the tools in /bin or /etc, and copy etc/* to your /etc and
edit the files to reflect your setup. The files do not have a .ttp or .tos
extension as that is ununix-like.

> Secondly, I've also got mfs610b.zoo, which I've un-zoo'ed, and I have several
> ttp executables.....
>
> Q. 2a. I've cleared out my G:\ partition....."What Now?"
Run minit.ttp like this:
minit g:
If you are using an awkward (for MinixFS) size partition you may have to
enter parameters manually.

> Q. 2b. How do I set up G:\ as a minix partition?
Do the above, and then reboot with minix.xfs in your mint or multitos folder.

> Q. 2c. What other files do I need to use it?
It depends on what you want to do with it. It will work as it is, but to use
it under GEM you'll need a MiNT enhanced desktop and/or fileselector. It
is more usual to use it under a shell like tcsh, in which case you need the
shell and file utilities etc.

> Q. 2d. How do I use it?

See 2a and 2b.

> Q. 3. Do I need (or have any advantage) in getting lynx?

If you want to use the WWW, then you need lynx. Otherwise there's no need.

> I've seen lynx, it's about 200Kb+ so I'm not going to download for the sheer
> hell of it......I'm on dial-up remember :(

I think I'm going to have a go at this, if only to post it everytime the
MiNTnet question comes up ;-)

It will depend on whether or not I can get round to setting it up from scratch again so I can make notes.

Eek! 1985-1986 BC I think ;-)

> They also say that Mark Williams C would be a good choice, and some
> others. I don't see these names around ANYWHERE anymore.

I would recommend Lattice or GNU C. Lattice is better for beginners, but
GNU is probably a better system once you get it set up. Sozobon may be worth
starting with at first because it is small and free (shareware?).

> What is the difference between "C" and the "C+" and "C++++++++" (however
> many plusses). I take it the plus version is a PC thing?

C++ is the "new" C. It introduces a whole new way of programming, including
object oriented methods.

> it I would think.
>
I made a little box of tricks that is stuck to the side of my desk.
Two long leads from the jostick/mouse ports enter the box.the one
from the joystick only port is soldered directly to a socket.
The other jostick/mouse lead has a switch to select between the
two sets of movement control lines.So that only one device can
move the mouse at a time.This is then connected to a socket mounted
in the lid of the box.I have only switched the movement control lines
because i could only find a four way double pole switch at the time.
but i suppose you could use a rotary switch for all of the lines but
they are expenseive.Since i made this box i have not had to touch
any joystick plugs. so no damage or wear on the ports or extension
just flick the switch and grab the device you need.
I got most of the parts from Maplin.Cost about 16.00ukp

Hope this is helps.

>effects processor for my guitar that can be linked via MIDI, which works
>fine, but the manual does not have *any* useful info on how to back up
>my patches (though I know it is possible). Also, is there any software
>I can get that will do this (PD or shareware). I would write my own, but
>I have no idea how MIDI stuff communicates...any docs or faqs that detail
>this?
>PS If it matters, I have a Digitech RP-10 processor

A librarian is in fact quite a simple thing to write (if you don't make it too
fancy, that is...). What it does is: send a message out the midi port like
"hey over there, send me a complete memory dump". The machine you're talking
to (your RP10 in this case) then sends the requested data. Most midi machines
support different dump-requests -- e.g. 'dump everything', 'dump all patches',
'dump patch no. 47', etc. Upon receiving such a request, the machine sends the
appropriate data to you.
Same story the other way around: a dump you once received and stored to disk
can be sent back unmodified (in general), and thus data can be restored.

Implementing such a thing also is quite simple. You use plain BIOS calls
(Bconin, Bconout, Bconis), install a bigger MIDI buffer if needed, and issue
the correct requests or dumps. Add a pinch of file i/o and a nice interface,
and you're ready.

The biggest problem is that you need a specification of the various dump
requests and other assorted system-exclusive information for your machine.
I own a Digitech DSP-256 and wanted to write a librarian too -- and of course
lacked the appropriate docs. So I sent them a fax (from Holland to the USA),
and 10 days later I had 60+ (!) pages of detailed information on their system
exclusive info for various machines (no, not including the RP10 :-). That's
what I call service...

So, my advice: write, fax or call them. Ask for Mr. Randy Thorderson (the guy
who helped me out some time ago) and ask him to send you both information on
the system-exclusive implementation for your RP-10, and their "General Digitech
Midi Implementation' document. Address and phone/fax numbers on the back of
your manual (or drop me a line if you can't find them). Next look up the
USENET midi primer (someone here should know on which ftp-site to find it,
or post a question in rec.music.makers.synth or in comp.music). This is a
collection of articles completely describing the midi protocol. Then read,
read and suffer :-).
And if you have any specific questions, feel free to drop me an email.
I still haven't finished my own DSP256 librarian (too busy), but I did write
a quite extensive librarian for the Korg M1, so I think I somewhat know what

I'm talking about...

Hope this helps somewhat... and good luck.

Hendrik Jan

Paul Wiffen at Digital Village.

btw can anyone refute the allegation that the C-Lab version of the Falcon
will cost 200ukp? I don'y know what configuration this would relate to
but I'd expect it's at least inclusive of SCSI drive and hardware fixes.

] > Very few Atari users have an Atari based CD-ROM unit
]
] Roland, I don't have any way of knowing what the typical Atari user has,
] but I do know a LOT of Atarians with CD-ROM drives hung on the back of
] their computers.

Why? Why spend hundreds on a drive and hardly be able to put anything in
it that can't be obtained via FTP? Besides, he said "Atari based"
CD-ROM unit, I presume that means one without SCSI adaptors and host
controllers etc. but a semi-made-for-atari one. Some exist, but the
only CDs I've seen for the ST have been full of PD & Shareware stuff,
hardly worth forking out large amounts of cash for, as you've probably
already got all the good stuff.

Here's a program I wrote 7 years ago to do exactly that.
It was intended for Mark Williams C on the ST, but looks pretty general.
It's one of my earlier efforts, but it worked OK at the time. I've
inserted some little comments that might bring it up to date a bit.

#include <stdio.h>

main(argc,argv)
int argc;
char *argv[];
{
FILE *fp;
unsigned char buffer[50];
int bcount; /* 16 bit int could limit to 32k */
void putblock();

if (argc != 2) {
printf("Try entering a filename!!\n"); /* fprintf(stderr, ...) */
exit(1);
}

if ((fp = fopen(argv[1], "rb")) == (FILE *)NULL) {
printf("Can't open %s for reading!\n", argv[1]); /* Ditto */
exit(1);
}
bcount = fread(buffer, 1, 32, fp);
do {
if (bcount == 0) break;
putblock(buffer, bcount);
} while((bcount = fread(buffer, 1, 32, fp)) == 32);

printf(":00000001FF\n");

exit(0);
}

void putblock(string, count)
unsigned char *string;
int count;
{
static unsigned address = 0; /* 16 bit unsigned. 64k limit? */
```

```
unsigned int checksum;
int i, high_address, low_address; /* Ditto here, for 32k */

high_address = address >> 8 & 0xff;
low_address = address & 0xff;
checksum = count + high_address + low_address;

printf(":%02x%02x%02x00", count, high_address, low_address);

for (i = 1; i <= count; ++i) {
checksum += *string;
printf("%02x",*string++);
}

printf("%02x\n", ((256-(checksum % 256))) & 0xff);

address += count;
}
```

This is really nasty - not for me of course!

Could copies of the WWW pages not be copied periodically to another
server, and just the last ftp'ing links go into mic2.hensa? Just a thought.

Could this be a ploy, I wonder, by the powers that be, to prove that Atari
at Hensa is in fact underused? So that they can close it down? I sincerely
hope not.

1677. WWW with an Atari??

Newsgroup: comp.sys.atari.st
Date: 1995-02-04 09:34:58 UTC
From: James Wood <jamesw@CSOS.ORST.EDU>
Message-ID: <Pine.SUN.3.91.950204013243.5107E-100000@PEAK.ORG>
Source record: 172128

As I'm a newbie, I don't even fully understand what a WWW site is, and how it differs from a FTP site, which I have used. (No, you don't have to explain to me if you don't want to...I'm sure there's an FAQ somewhere that will tell me).

My question: What is necessary to get on one with an Atari? It has been my observation that some sort of software is necessary, which is only available for PC or MAC. Any suggestions? Thanx in advance.

James

1678. Repair/upgrade shop in Seattle?

Newsgroup: comp.sys.atari.st
Date: 1995-02-04 09:52:52 UTC
From: DOMINGO@news.delphi.com
Message-ID: <3gvipk$8t8@news2.delphi.com>
Source record: 172129

I am looking for a repair/upgrade shop to do some work on my brother's Stacy and my Mega ST4. Anybody you recommend?

Dom

P.S. E-mail responses please. While I do read this newsgroup, it would be easier via e-mail.

1679. TCN repair guy?

>Very frustrating..............

I'm wondering: maybe Digidesing force them to drop Falcon in USA because
a Falcon system with FDI/FA-8 is a direct alternative to Session 8 - and
costs 1/3rd of the price. Maybe that's also reason why Logic Audio Falcon and
Cubase Audio Falcon was omitted from Keyboard december issue, from the "digital
audio programs" -list. I'm still wondering....

Help!!!!!!!!!!!!!!!!!!!

I can't kill the Dinosaur on the amazon level either - it only comes out at night

However, you can get through that cave system another way - if you go up the
hill above the crash site on the first world you can get into another cave system
This will take you past some teradactyles and into a desert world -
goto the right hand bottom corner of this map and go into the cave -
this takes you into the top of the cave system where the t-rex lives during
the day - their are also two baby t-rexs - these are easy to kill. Below them
another entrance to a different world is reached - with walkers and robots, the la
tter of which continually kills me -I think I need a heavy lazer - I know their is
one but has anyone found it yet!!!!

: what about formatting and partitioning the drive?

Check the ID numbers and the parity, and make sure the first and last
drives in the chain have terminating resistors on them.

: Do I have to reformat and partition my existing drive too, or will the
: software see these as two different physical drives, allowing me to
: format one and not the other...?

No the the old drive(s) will be seen as such, but if you want to name the
new drives the same as the drives obviously there'll be trouble :-).

It is :-)

> * 68030 (?? MHz)

Standard of up to 50MHz. Some folks are slowly getting close to the lower
UKW-radio band ;-))

> * fast ram expansion slot (?? Mo)

4 or 16 megs of fast-RAM in standard 32-pin simms.

> * faster than a TT (Qindex? Gembench?)

Way faster. No benches, though.

> * suitable for a mega ST box

Yep.

> * needs 68000 unsoldering (OUCH!)

Yep.

> ? TOS versions

TOS 2.06, 3.06, KAOS, Mag!C. The best is to have either KAOS or the PAK-TOS
3.06 on the PAK itself, as it is split into 4 Eproms and therefore gives you
32 bit access. Talking speeeeed here :-)

> ? compatibility

Good. All cleanly written stuff will do just fine. A lot of games won't work.
But those won't work on a TT either.

> ? FPU slot

Yep, most certainly so. And the FPU can have a different, higher clock than
the CPU. I am aware of one PAK with 60 MHz CPU- and 70 MHz FPU-clock with a
mainboard clock of 10 MHz (or was it 12, not sure ATM).

> ? Linux development

Will work on a PAK if you have the FPU.

I still use it. And am rather content with it. I only wished it did
not store all the escape sequences during file capture.
It use a ZMODEM program with it. It seems to keep up well with
19200 bps/14K4 modem with compression.

First of all, why not read this newsgroup and maus.sys.atari.mint for
a while before asking those questions?? I'm answering about the same
questions as this one about every day (I did, yesterday), and I would
really wish people to read the articles for some days before posting
their questions.

Well, the versions of mint and minixfs you mention are _very_
outdated. I had about the same problems with an old version of
minixfs. It doesn't seem to work alright. Try and get mint 1.12 and
minixfs 610 (don't know if it's 6.10 or 0.61 or something). They work
alright. Second, all the other stuff in the MDK is just as outdated as
the mint and minixfs versions. So, you can install your minixfs
partition once again by doing
minit.ttp -P -V -n2,
and you can use the programs included in MDK for a first start. But
you should definitely spend some time in looking around for newer
versions of all the software (a.a.u.e). What's a good aspect in having
MDK is that you already know, which stuff at least belongs to a full
installation.

If you still have questions after doing all this, just mail again.

> My little brother complains to me since I added 4Meg to my mega ST.
> It seems that some games don't like extra memory space. I also remember

When I added 4megs to my old STE, some games didn't work. I worked that out by loading a reset-proof ramdisk (2meg size). It should work in most of the cases. I used Ramplus for the job.

> His biggest gripe concerns F29. What would you suggest as a flight sim
> replacement ?

Hmm... I couldn't get F29 to work even with ramdisk. But for a good flight sim I would recommend Flight Of The Intruder. I really liked it.

Hi. Yes, Llamatron is available for the PC...

It looks virtually identical to the Atari version and if you have a SB or better, it sounds just like it too.

BTW, I wouldn't say that Llamatron is THE best game ever for the ST.
Mind you, it is quite good but certainly not the best.

Games like Time Bandits, SunDog, Cannon Fodder, Realms, Falcon, Star Wars, Starglider II, Arkanoid II, and Mrs. Munchie are just some of the ones that come to mind...

Message-ID: <01HMNJNK3KOY8WW89K@SNYONEVA.CC.ONEONTA.EDU>
Source record: 172066

In Short, new Falcon prices suck!

If priced at what 1040Stes are selling for then the Falcon is a good buy.
But, for what it costs, what you get, and what it does its no bargin
new or used!

I've been out of the Atari scene since late-summer and I was surprised to
find out that new Falcons are still selling for their traditionally high
prices. Meanwhile, PC prices (and Mac too as much as I don't like them)
continue to drop. What gives? Atari is out of the computer business -
I'd figure they would just price their remaining stocks enough so they
could move them out of inventory and just write off the R&D and production
costs as a loss.

Flame me if you want but Falcon pricing is almost criminal! My Falcon was
valued at around $1,500 US when I got it - and that was w/o a separate monitor
and just 4 megs, all of the software (Speedo, MultiTos, Atari WOrks, etc.),
and the 85meg HD. It really began to bother me when I could get a cheap
PC 486SX-33, with 4 megs, a 200+meg HD, an SVGA card, an SVGA monitor, and
maybe a cheap SB for the same price - plus, it's cheaper to expand, faster,
and there's a hell of alot more applications for it.

Now PCs have plenty of problems but it makes me sleep better at night
knowing that I can run what I need tommorrow or the company I just bought
from is not going out of business anytime soon.

Just my opinion...

Ari

Hello:

Titan Designs in the U.K. are selling flat-bed scanners and mention a scanning module for their ImPro graphics program. You can reach them via email at the following address:

100345.2350@compuserve.com (David Encill)

Alternatively, I think DMC of Calamus fame also have drivers for flatbed scanners, they can be reached at:

potechin@genie.geis.com (Nathan Potechin)

Please post if/when you get your scanner working. I've often wondered if it was possible to hook up a standard flat-bed scanner to an Atari. I'd be especially interested in knowing if you could connect one to a Falcon.

1720. Tuning.faq ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-05 04:08:14 UTC
From: simon@kingres.demon.co.uk
Message-ID: <791957294snz@kingres.demon.co.uk>
Source record: 172067

I've recently been reading through Demon's 'Tuning .faq' about getting best throughput on my system.
Having read this I thought it would be best for me to have smaller data than I am currently using because I usually use telnet or ftp whilst getting news and e-mail. So I altered mru to 576, mss to 536 and mtp to 476 as described in the .faq but upon dialing up demon via the Luton Vpop it logged in fine and semmed to connect but once I'd got the 'hello' message the modem just disconnects. So after trying this a few times I decided to change the settings back to 1500,1460,1500 respectively and all works o.k.again ?

Anyone know why I can't lower the packet size ?

Also I've used the 'asystat' command to cheque for h/w and s/w overruns, this was the result during receiving mail.

sl0 19200 baud (AUX:Unit 0)
RX:191383 chars 0 o/r 0 in buf h=27592 t=27592 b=32767
TX: 10156 chars 416 o/r 428 in buf h= 230 t= 230 b= 256

Can anyone tell me what this means as the .faq explains it for the pc which is different from the above for my ST.

> Q. 1. Do I have to compile any of these?

No. The package also contains pre-compiled binaries (SOCKDEV.XDD and a couple of .XIF-file). Look in the sub-directories. BTW, RTFM!

> Secondly, I've also got mfs610b.zoo, which I've un-zoo'ed, and I have several
> ttp executables.....
>
> Q. 2a. I've cleared out my G:\ partition....."What Now?"

Put MINIX.XFS in c:\mint or c:\multitos and reboot your computer. When MiNT loads it will also load MINIX.XFS which adds support for Minix File Systems to MiNT.

> Q. 2b. How do I set up G:\ as a minix partition?

Start MINIT.TTP and enter G: on the command-line (but read the documentation first, there are a couple of switches you might want to add!).

> Q. 2c. What other files do I need to use it?

To be able to use the extended filesystem you will need a GEM-shell that understands long filenames (like Gemini) or a normal shell with fileutilities that understands long filenames.

> Q. 2d. How do I use it?

I`m not sure I understand this question. MFS (MinixFS) adds support for Unix-like file-operations including symbolic/hard links, long filenames and extra bits to control file-access. Just use it as you would use any "normal" Unix-system when it comes to file-operations.

> Q. 3. Do I need (or have any advantage) in getting lynx?

Lynx is a HTML-viewer and will let you "surf the net" from your local computer as long as it`s connected to the rest of the world (through

a SLIP/PLIP/PPP-connection). If you want to use Lynx you do of course
need to get it. ;-)

Disregard the "Looking for monitor" message. Found monitor.

However, it's a Commodore 1084s. Excellent monitor! It has ALL inputs I wanted:

1) I can put my VCR on the single composite input, and tune in to TV.

2) I can put my Classic Atari8 on the "split" composite, and sport the best video the Classic is capable of.

3) I can attach the ST to the Analog RGB port, BUT I NEED A CABLE!!!

I do believe this was realtively common - to use the Amiga monitor on the ST. I know that Amiga owners have used the SC1224 in the past, because I have seen Amigas running them.....thought they were some sort of new Mega-ST until I got up close and saw the C= signs.

Failing that, I'll have to hire out to have a cable made (oh no...$$$) or attempt one myself. I didn't receive a manual with pinouts (no manual at all, in fact) with the Amiga monitor)....and I don't know the pinouts of the ST....or what needs to be connected to what. If someone can Xerox this info and send it to me, I'd be happy to send a couple bucks.

I HAVE sent e-mail to Toad computers. I'll call around to the Atari vendors listed in the FAQ on Monday. Anybody else done this?

James

1728. SC1224 for sale

Newsgroup: comp.sys.atari.st
Date: 1995-02-05 09:22:19 UTC
From: ralunsfo@uncc.edu
Message-ID: <3h25cb$gaq@news.uncc.edu>
Source record: 172073

I am thinking of selling my SC1224 color monitor, if I can get a good price for it. I'm not quite sure what to ask for it, but it is one of the newer models and is in almost perfect condition. If anyone is interested, I may let it go if I like the price...

Thanks,
Russ

>HM> Tell me which features of a TT have to be supportet explicitly?
>The FPU and the LAN. The VME cost damn lot of money, and still miss alot

Hardly any application makes use of a floating point unit. The ones that do,
come with a special 68881 version.

LAN is used by some shareware (PD?) applications to build smaller networks.

>HM> A 486DX2/66 is way faster in raw calculating power than a 68040. And there is
>HM> no 66 MHz 68040 at all.
>Wrong again. (wasn't you the one telling me to get my facts straight ?)
>A 68040 running 33Mhz is running 66Mhz internal! Just like the DX2 machines.

Nooooooooooooooooooooooooooooooooooooooooooooooooooo it isn't. Damn.

The 68040 has two clocks:

Bus Clock BCLK Clock input used to derive all bus signal timing

Processor Clock PCLK Clock input used for internal logic timing. The
PCLK frequency is exactly 2x the BCLK frequency

PCLK is _only_ used for timing of some internal logic-groups. All instruction-
and floating point units use *BCLK*. Period.

This is from the comp.sys.m68k-FAQ:

```
-------------------------------------------------------------------------
| Feature | 68000 | 'EC000 | 68010 | 68020 | 68030 | 68040 | 68060 |
-------------------------------------------------------------------------
| Data bus | 16 8/16 16 8/16/32 8/16/32 32 32 |
| Addr bus | 23 23 23 32 32 32 32 |
| Virtual memory | - - Yes Yes Yes Yes Yes |
| Instruct Cache | - - 3 256 256 4096 8192 |
| Data Cache | - - - - 256 4096 8192 |
| Memory manager | <+ (68451 or 68851) +> 68851 Yes Yes Yes |
| FPU interface | - - - 68881 or 68882 Internal FPU |
| built-in FPU | - - - - - Yes Yes |
| Burst Memory | - - - - Yes Yes Yes |
| Bus Cycle type | <++++++++ asynchronous +++++++> both synchronous |
| Data Bus Sizing| - - - Yes Yes use 68150 |
| Power (watts) | 1.2 .13-.26 .13 1.75 2.6 4 - 6 3.9-4.9|
| at frequency of| 8.0 8-16 8 ? ? 25-40 50-66 |
-------------------------------------------------------------------------
```

So you better check again, buddy.

>And the 68040 33Mhz is just about to available by now.

The XC68040 has been available for a loooong time. The final MC68040 silicon
came out late 1994.

>the developers have sold enough. The 68040 itself doesn't cost that much.

It doesn't?

>So it all depence on the market, which again is depending on the software.
>Personally i'm willing to pay between 5-600$ for an 68040 upgrade, and

You won't get a Barracuda for this amount at all.

> Motorola 68060 at 64 MHz

I'd say currently not available at all.

AFAIK, not a single _working_ Eagle has been shipped yet. Some folks over here
are _really_ *angry* with GE. Promises, loads of promises, but nada, zip,
zero, nothing, nuffik, was held until now.

The Medusa T60 could be shipped, if Fredi would get 68060 cpu's in
considerable amounts.

It's a Network Filing System. It allows you to mount remote drives and use them as if they were local drives - you can mount src.doc.ic.ac.uk if you want.

It's in the MiNT/network directory of a.a.u.e. and is called nfs042.tgz or something.

You can get 800x608 using just software. And the only extra hardware
needed to get 1024x768 is a faster dot clock.

You can with MiNTnet (this may depend on your internet provider, but it
should be possible to set it up as a full internet site). It comes with
ftpd and telnetd.

The first Atari monitor was very good (JVC) 0.38 mm dot pitch, but they then
whent to lower resolution ones, 0.42 dot pitch, this pitch is now used by most
high end TV's, the old TV dot pitch was 0.65 mm...

The CM8833 and otheres do make very good TV screens...

> * 68030 (?? MHz)

from 16 up to 50 MHz possible.

> * fast ram expansion slot (?? Mo)

there's the FRAC (Fast-RAM-Card) which you can plug onto the PAK.

> * faster than a TT (Qindex? Gembench?)
> * suitable for a mega ST box
> * needs 68000 unsoldering (OUCH!)

Yes.

> But what about :
> ? TOS versions

Unpatched TOS 2.06 works, but it has no PMMU-support so the FRAC doesn't
work with it.

Patched versions of German and English-TOS 3.06 are available.

> ? compatibility

no problems.

> ? FPU slot

is on board.

> ? Linux development

I don't know the actual developments, but for a long time there did not
exist drivers for the ACSI-Port.

It is commercial but probably hard to get hold of now. It was published by Michtron/Microdeal in the UK. It might be worth trying Hisoft or putting a 'wanted' ad on one of the Atari boards. I tried it under MultiTOS on my Falcon and it appears to work just fine. The main attraction for C-Breeze is its configurability - it comes with .cfg files for Mark Williams, Meagamax and Lattice but with a bit of work you should be able to adapt it to anything (even other languages).

Well here in Kapiti some 60k north of Wellington, we have a few (5) Shops
that sell books/Mag/papers etc...

One think that I have notice is the number of Amiga mags plus
other computer mags that these shops stock...

One shop had over 6 Amiga mags, in fact in all these shops. their are more Amiga
mags than any other computer platform...

How come, thier are no shops here in NZ, selling Amiga stuff at all, and only
one shop around here selling PC clones...

IMHO these games are pretty good or *amazing*:

BUBBLE BOBBLE
CARRIER COMMAND
DEFENDER II
ELIMINATOR
ESCAPE FROM THE PLANET OF THE ROBOTS
GAUNTLET II
IKARI WARRIORS
MIDWINTER
ONSLAUGHT
OPERATION THUNDERBOLT
OUT RUN
PARADROID 90 (on the Spectrum it was the best)
RICK DANGEROUS
RICK DANGEROUS 2
SPACE HARRIER
STAR GLIDER II
SUPER HANG-ON

Um, maybe the point is that it is useful to people in th UK? I know that
may seem like a bit of a logical jump there, but I could just be right.

> To me Danny you might as well close the Atari section for good, if you can't
> support the world what is the point...

Allow me to introduce you to a program called ftp. It allows you to grab file
from ftp sites (hence the name), without using WWW.

> Atari Hensa R.I.P.....

IMHO it is by no means RIP - its just starting to get good, and using FTP is
no trouble - I've never grabbed files using anything else.

> Is this the way that Internet is going, or should I say Net as it looks like
> it will not be International in what Hensa is doing, or should Hensa
> be removed fron Internet....??

You're right. If the powers that be close off public WWW access to HENSA it
will probably mean that the entire Internet will follow suit. I can see the
logic in that. And sure, lets all mail the HENSA moderators and ask them to
take out the FTP support too. That will show them. It doesn't matter about
losing an FTP site.

Now back to reality:
Please stop posting such over the top complaints about things.

When I upgraded my STe a couple or three years ago, I had a similar problem.
It would act as a 1meg machine or a two meg, but not 4. Odd, I thought.
I tried all ways to work it out and gave up. I sent the thing to the man
with the repair knowledge, and he was most upset in the end. it took him
four days to trace a fault on the pcb (motherboard). Ten minutes to fix it,
but he'd quoted me a fixed price...
Maybe you have similar troubles.

The internal drive is 2.5".

But you can fit 3.5" drives, and yes, even with SCSI-bus into the Falcon.

JDG>Help me! I am looking for a utility that reads Atari files and
JDG>writes them to an Amiga/PC. Please help me!!

Atari STs use the MS-DOS file format, sometimes you have to create
an MS-DOS boot-sector using a virus killer. On the Amiga there's a
utility called DOS2DOS allowing you to read MS-DOS disks.

>from is not going out of business anytime soon.

Falcon is a computer for music applications. Period. It does things that
are not available for PC. A couple of weeks ago one PC programmer came
to see my Falcon setup, because he couldn't find anything else from the
market to do the job (his band's next record) without getting a large
loan. There are a lot of musicians seeking out Falcon info, because
they do not want to put twice the money on a Digidesign system and a
Mac.

If MultiTOS, Speedo and Atari Works are application types you use,
forget Falcon and get a PC. For music get a Falcon with 14Mb RAM.
It costs a lot, but it's still cheap for what it does, even with
tower, Monitor, ScreenBlaster, FDI, SMP-II and FA-8.

Sorry but I had to say it. With music, PC sucks. Only alternative when
using a PC in music producing (in the same price range) is PC/Cubase
Audio CBX-D5 and Yamaha CBX-D5. But then you'd get only 4 tracks of audio
(max 8 with 2 CBX-D5's), and Falcon gives you 16 if needed.
And before every PC-owner give their view about how wonderful PC is
in music: I'm talking about *integrated* MIDI/Audio/Notation/Sync
-programs with digital I/o etc. (switching programs when editing is
not my view of efficient working).

1754. Network a TT030 with a Macintosh?

Newsgroup: comp.sys.atari.st
Date: 1995-02-05 19:03:34 UTC
From: japolis@nyx10.cs.du.edu
Message-ID: <3h37e6$9td@nyx10.cs.du.edu>
Source record: 172095

Hello!
It is my understanding (perhaps erroneously?) that the "network" connector on the TT030 works very much the same as AppleTalk on a Macintosh. Has anybody successfully networked a TT with a Mac? I assume that additional Atari software would be nessecary, does anyone know where it may be had? Commercial or PD or shareware? What sort of problems or hurdles have you encountered? Is there an additional hardware interface required?
Thanks in advance for the assistance and the advice!
also, if you would be so kind, please mail replies to me. I'll check here too, but sometimes news gets deleted from the system before I can read it!
Thanks again!

>Question is, do I need to do anything aprt from just plug it on? Also,
>what about formatting and partitioning the drive?

Three things I can think of:

SCSI ID, parity, and termination.

The drive will have a set of pins which you link to set the SCSI ID.
Which model do you have?

Most drives also have a link for enabling parity, others use a software
command. On my SCSI devices, attached to Falcon I have parity disabled.

Some drive manufacturers, eg. Seagate and connor, have a UK BBS from
which you can download the drive specs. incl. link details.

The last unit in your SCSI chain should be terminated, this can be done
using resistors on the drive, or a terminating connector on the cable.

You can partition the drive to suit your requirements.

>Do I have to reformat and partition my existing drive too, or will the
>software see these as two different physical drives, allowing me to
>format one and not the other...?

No need to reformat or partition your current drive.

You have to use an alternative desktop running in the MiNT domain, Gemini,
for example. You should also get a file selector supporting long filenames,
MfsfM or BoxKite.

> etc.

Yes, it would definately be possible if your PC-friend allows SLIP
or PPP connections. The easiest way would probably be to use NOS. I`ve
heard it`s quite easy to set up.

If you want a more complete (and complex) system you should try MiNTNet.
It`s not easy to set up, but once you`ve got it up and running it can
handle anything you throw at it.

1769. MiNT 1.12h2 problem

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 00:25:20 UTC
From: robotron@moroder.demon.co.uk
Message-ID: <199502060025.AA02631@moroder.demon.co.uk>
Source record: 172013

I've been getting the following error every time I try to leave MiNT 1.12:

pid 0 (MiNT): kfree: memory not allocated by kmalloc
Fatal MiNT error: adjust debug level and hit a key..

Then when I press a key:

FATAL ERROR. You must reboot the system.

I originally thought this was somehow connected with MiNTOS - it happened every time I tried to "halt" the system, which worked perfectly with 1.11 - but today I trimmed my installation down to a minimum (nothing in the auto folder, and no device drivers) and set up a mint.cnf file containing only
INIT=d:\home\tcsh
and I got the error as soon as I tried to "exit". This happens with both TOS 2.06 and TOS 1.6.

Has anybody got it working (i.e. when you "exit", it takes you back to the desktop), and if so, how?

Stephen

1770. ftp mirrors?

Newsgroup: comp.sys.atari.st

This may be a typical newbie question, but as a newbie I just gotta ask...

I want to upload a program I`ve written to atari.archive.umich.edu, but can NEVER get connected - it`s always too busy. Will uploading to one of the mirror sites work, or is this a one-way system?

Vegard Hofsoey

> It has more control lines then a MFP-modification, which has NO (0)
> of them.

But can I use both the LAN-port and the normal serial port at the same time? I thought the SCC only could handle one at a time.

BTW, I really don`t need any control-lines since I`m only going to plug in my VT100-terminal...

1773. Dan's Atari Lynxlist! (trade, sell & buy games & accessories)

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 02:50:07 UTC
From: SA073@getty.onu.edu
Message-ID: <SA073.223.2F358E5E@getty.onu.edu>
Source record: 172017

Games are listed in all capital letters, to distinguish them more easily from names and addresses. There are 3 simple things to remember when listing your games. $ means for sale, = means for trade, and ! means wanted. For example, if I wanted to sell Joust, I would write it like this in my list: $JOUST$, and if I wanted to trade joust, it would be =JOUST=, but if I wanted the game, and did not have it, I would write it at the end of my list, !JOUST!. In fact, please put all of the games you have for sale, for trade, and the games you want at the end of your list. It will make it easier for everyone to find, and also for me to change as games are sold, traded, and bought. Also, if you happen to have a game you would either trade or sell, instead of writing it twice, just write it once and put both marks around it, with your preference closer to the name of the game. For instance, if you wanted to sell, but would also trade, you would write it as =$JOUST$=, and if you would rather trade, but might sell, you would write it as $=JOUST=$. I hope this simplifies the list a little bit.
In each case, the games are located below the name and address of the person who has or wants them. Keep in mind that a person may sell a game that is for trade, if you offer enough. Or they may trade for a game other than the one they wanted, if you can work out a deal with them. Feel free to include any games you own or other info in this list.

There are now 61 Atari Lynx owners in this list. If you are one of the
first few people without a name, or with part of your name missing, please
take the time to e-mail me so that I can fill in the missing information.
Also, if you want to include any other information, feel free to do so.
I have been thinking of adding something to the end of this list. Perhaps
some type of game review would be useful? I have only played about 10 of
the almost 80 games available for the Lynx. Although I think that Nick's
game ratings are helpful, they do not give a good overview of the reviewed
games. I was thinking about adding some type of overview at the end of the
Lynxlist. I'm not sure what to call it, but that's what it would be about

anyway. Some of you could do quite a few reviews, it looks like. So, do any of you like this idea? The review could focus on 1 or 2 games. You would have your name attached at the bottom of your review, of course. I think I would put Nick's game rating of the game at the top, and then follow that with the review(s) of the game(s). Reviews should be about a paragraph, and tell specifically what you liked or did not like about the game, it's replay value, sound, etc. If enough people write back and think this would be a good idea, I'll incorporate it into the posting of this list.
Hope you enjoyed everything, and I hope you find this list useful. If you sell a game or anything, let me know so I can update the list.

D>and 'parent' directory!!!!

(I did not follow the whole discussion, sorry if I mistook your statement.)
BUT: If you are looking for an alternative desktop that handles
long_filenames_under_MINIX.well :) then do take a longer look at THING 0.26
which does this job (and others) excellently.

Cheers,
Dirk.

1775. Gophering to Hensa...

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 03:29:05 UTC
From: sheppard_r@ix.wcc.govt.nz
Message-ID: <3h4521$mmt@golem.wcc.govt.nz>
Source record: 172019

Well you can use a Gopher site server to get access to Hensa, via FTP,
but the Big problems is that a lot of Atari files can't be accessed..

This is the Big problem with Gopher, is does not let you decide
if a file is Bin or Txt...

So all those files that end with .tos,.msa,.z,.gz,.prg,.lha
plus a few otheres can't be accessed...

I tried last night here Sunday and could not get on but to-day
Monday was OK...

Is thier any other way....

Message-ID: <792044614snz@bassland.demon.co.uk>
Source record: 172022

Okay, so I now have my pretty smart Falcon sitting in my bedroom, connected
to my USRobotics 14,400baud modem. Question is can I get more than 19200 bps
out of my serial port? Apparently, speeds of up to 115000bps are possible
with a little hardware upgrade. *A software patch would be ideal*
I'm looking for 38400, or 57000bps......

Cheers

I'm using ICD software with my ICD AdSCSI+, and you'll be able to access
the new drive through your software. It'll show up as a different physical
drive to do with as you want.

1783. FLOPPY HELP

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 05:47:16 UTC
From: scott@santafe.edu
Message-ID: <SCOTT.95Feb5224716@sfi.santafe.edu>
Source record: 172026

HELP!

My 1040st internal floppy drive's motor stopped working.

I have access to 6 floppy drives... 4 are the 1.4MB style and 2 are the 720K style. I've tried working for about 5 hours now to solder power leads into the two 720K drives, but I can't seem to get any response out of them other than some noises that sound like the drive's are being under powered.

I have a few questions....

are all 3.5" drives pretty much the same in terms of interfacing? I'm trying to use the 1040's red/blk/blk/blue power leads which I thin are 5/g/g/12 respectively. Also, I'm using the floppy cable that's inside the 1040 (34pin?) ...

I can't seem to get any positive results. Can anyone help me get these floppies wired in? I'd just like to get a floppy working again. Right now I'm running with no floppy hardware installed and I can run off my hard drive-- but I have a lot of software on floppies that I'd like to get access to.

I do not read this group anymore since I moved over to sun computers-- but I would like to get my ST going again and hear any responses people may have -- so, would you please respond by sending mail to scott@spy.org?

thanx!

Scott

1784. Re: Using MintNet with TIA?

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 08:55:16 UTC
From: roemer@dares.rbi.informatik.uni-frankfurt.de
Message-ID: <3h4o5k$v0@zeus.rbi.informatik.uni-frankfurt.de>
Source record: 172028

In <3gr32l$7tb@batph8.bnr.ca> troyc@bnr.ca (Troy Carpenter) writes:

>Has anyone tried MintNet with TIA? (see http://marketplace.com)

>Does it even work with MintNet?

>How does it help/hamper the performance of MintNet?

Well, I've tried TIA some time ago over a 2400 baud line with MintNet on the
other end. It worked quite well, cslip ftp throughput at ~260cps.

>The limitations of TIA would keep you from telnet'ing and
>ftp'ing to my atari (but not from, thank goodness), but how does it
>work for X? (I would guess not so well)

Well it should work in principle (haven't tried it), but X is even over
compressed 14k4 rather slow.

>Is it worth the trouble to set it up to use with MintNet? (given my
>company does not have true PPP/SLIP access at my site, It may be my
>ONLY choice, no matter how good or bad.)

Your choice. When I tried the eveluation licence of TIA, they had only
a beta test version for HP-UX 9.01 with a few remaining bugs. If they
are removed by now, it's probaly getting it (the installation on the Unix
host side is rather trivial, just run the program).

And besides, forget about that liars saying "TIA stresses your providers
system more than usual". ftp over TIA sucks not more and not less perfomance
than using zmodem to download files. telnet over TIA sucks not more and not
less performace then logging in directly (except from the TCP/IP protocol over-
head, which can be ignored for a few keystokes per second as well as for
large packets as with FTP).

Those saying "TIA stresses your providers system more than usual" are the
providers of the Accounts, because Shell accounts are cheaper then SLIP or
PPP accounts, and with TIA you can convert a shell account into a more or
less useable direct Internet Account.

Kay.

bah, looks like my 32MB miniscribe 8425 just went south... after
formatting it 3 times, the old data is *still* there!

ug.

anyway, does anyone have a scsi controller they'd like to sell me
CHEAP ?

I'd like to stop foolding around with these 10, 32 and 60mb disks and
jump right up to 200, 400 and 1GB disks on the atari :-)

oh, does anyone have a mega4st they'd like to sell?

Scott
ps: please respond to scott@spy.org

Well, I got X11 on FTP, and I install it on my Falcon 4Megs, and the only thing it absolutely needs is Mint-Net (recent version, like the 0.70 I use).

It is a little bit difficult to install because of the directories it needs to create. You need to run it in monochrome (I have a TV so I use 640x200 mono, configured with Bootconf from Uwe Seimet (Is it available on FTP ? I don't know). A thing you must know is that it configures the Falcon's Keyboard in QWERTZ (deutsche thing !) It is really a pain when you type commands with a font 5x7 (the only font given with X11 for Mint+MintNet). It requires a lot of memory to run. 4megs is really just. I don't manage to get Outside running under Mint, and I can just run TWM , a, xterm , the xclock or the xeyes. I think you won't have such a problem.

Also I didn't manage to get TWM running automatically at the boot time. Well, it could be something good that X for Mint uses the VDI for screen output. It could permit the use of every graphic card. If someone could say me where to get X11R5 sources, I would be pleased to build a good version, who also uses it to scan the keyboard and use the GDOS fonts for output when available.

I hope that it would be available soon.

Whatever, I am sure he has considerable influence.

Hmmm those who seem to be skeptic about the C-Lab Falcon (hey Hutch hope you're reading this) ought to check out the latest issue of ST Format and in the News section there is (surprise surprise) a little box detailing information about the C-Lab Falcon, when it will be out and future developments from C-Lab.

Is anyone interested in buying any ST stuff? Everything is in excellent condition:

Zydec external disk drive with PSU - 30 pounds
Clear Powerplay Cruiser Joystick with autofire - 6 pounds
Midi leads - 5 pounds
Stos Manual - 3 pounds
Games: Mercenary & the 2nd City - 4 pounds
Speedball - 4 pounds
Silkworm - 4 pounds
St Basic & Manual - 4 pounds
Blitz copying lead & software - 4 pounds
Lots of ST mags (mail me for a complete list)

I also have various other bits 'n' bobs including lots of excellent quality DS/DD disks which I will sell for 30p each, or less if bought in bulk. All of these
prices are open to negotiation. P&P is additional.

Some great ST games I used to enjoy killing a few hours over:-

STUNT CAR RACER - Geoff Crammon struts his stuff before turning F1 on us.

MIDNIGHT RESISTANCE - Very nice little arcade platform shoot-em-everywhere.

SPEED BALL 2 - Bitmap's legendary 'sim' (without the 'ice cream' sample)

SIM CITY - Hey, its a classic, even if it is badly GEM programmed.

RESOLUTION 101 - Plot, what plot? Just fly 'n kill in glorious 3D.

You could do worse than try some of those classic Infograms adventures if
you want a real mind-fest. The only problem is, how will you obtain any
of the above?! Hmmm either they start re-releasing games, you pay lots
for classified ads seeking 2nd-hand copies or someone starts an
Automation FTP site ;)

I've started having a problem with the CLI in Gemini. When running a .TOS or a .TTP program, the CLI doesn't run it in the window anymore, but runs it in full-screen mode, meaning that I have to tidy the desktop when the program has finished.

Is there anything in any of the config files I can change to fix this?

My setup:

520 STFM with 4M of RAM
TOS 1.2
Gemini 1.2

Thanks in advance...

Kayvon Ghashghai asked about 9-bit/8-bit SIMMS:

Strange.

The ST does not use Parity checked memory, so only uses 8 bits at each
location on the SIMM. Sounds like the 8 chip SIMMS don't want to play.
If this were a different computer I'd say they were WAY TOO SLOW but the
8MHz ST is quite happy with 100nS memory - I've got an STFM with two
8 bit 100 nS SIMMs on a daughter board and they have been working fine
for a year now. I beleive that Apple used a non-standard SIMM for a
while - is this where you got yours?

Good luck,

```

I've seen IDE adaptors advertised for the ST. I phoned
up Gasteiner (UK) about them but the 'TECHNICAL' rep I
spoke too didn't know diddly-squat. He thought he did though
and talked a lot of *^$#!

what I want to know is:

Where it plugs into my ST - I know there is an external version
that takes up the cartidge slot, but what about the INTERNAL one-
I've already got extra stuff shoved in my MMU and shifter.

Does it autoboot?

Do they come with OS patches?

Would my PSU (in a STFM) cope with a 3.5" HD or would I have to
run off a seperate supply?

Is anybody out there using one?

Cheers,

1803. help with X11R5 installation!

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 12:36:25 UTC
From: tkk@uclink2.berkeley.edu
Message-ID: <3h5549$mgj@agate.berkeley.edu>
Source record: 172047
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Okay, so I've got the latest version of Mint(v1.12) with latest version of MintNet(v70) installed. Now I'm stuck trying to install X11R5. Just like the installation README says, I've created a 'neu' directory -- I call it X11, and I've unzooed X11R5.zoo into this directory creating /etc /usr /home etc subdirectories in the process. Then I create a whole new mint.cnf file in the mint folder with entries from the README file. Then, the instructions says to reboot the computer, and I should get a "xterm" and "xclock".

When I did this the first time, I got a couple of file not found errors, and Mint is exited.

Noticing that the lines exec X11\bin\kbd and
exec X11\pty\pty were a little weird, I change these
to exec X11\usr\local\bin\kbd, and
exec X11\usr\local\bin\pty since that's where I found kbd, and pty.

So I again reboot the computer, and now it says:

xinit: file not found (error 33): no server "X" in PATH
Use the --option, or make sure that /usr/bin/X11 is in your pathand that
"X" is a program or a link to the right type of server for your display.
possible servers include:

xinit:server error

Help!! What are the right entries to have in my mint.cnf file? And how should the files in X11R5.zoo be placed in my directory?

: OK Troops, here's my problem: I'd like to download some ST programs and
: utilities off the net, but my only real access is through my Mac at work.
: So how do I get executables from the Mac onto the ST? I got some uuencoded
: files which decoded (on the Mac) into zip files...where do I go from here?

: I'm hoping that somebody out there has "been there...done that" and can
: post a solution for me...

Simple mon amigo... just format your DSDD disks as PC, download your
Atari files onto the Mac hard drive, copy 2 floppy, take home, insert
said floppy(s) into faithful Atari drive and play away. Certainly saves
uuencoding all this stuff. The only problem I can see is if the file is
too big to fit onto said PC formatted floppy.

Hi...I am not sure if this has been discussed here...and if it has I am sorry.

I used to have a Atari St and I do not anymore, but my cousin does and he wants to get software for his Atari ST so he can get a PPP pr SLIP account on the Internet. I have a MAC and we have a WEB Browser, Fetch - For FTP Sites, Eudora - Mail Reader...etc...
There must be somethong out there for Atari? A Internet Package? Something he can use besides a basic Shell Account??

Please help..I obviously do not get to read this group often so could you please send details to my internet address below?

Thanks for any help in advance!!

From: krieg@allmalt.cs.uwm.edu
Message-ID: <3h5e7a$r64@uwm.edu>
Source record: 171958

I picked up a couple of games at a flea market that had no instructions. They were "Batman: The Caped Crusader" and "The Munsters". Could some kind soul please give me a clue as to how to play these games?

In the Batman game, I figured how how to pick things up, but I don't know how to use anything (besides the Batarang). How do you use the wrench and floppy disk? What are the possible actions through that weird interface of boxes? The graphics look good, but gameplay is awkward since you have to leave the field of play to do anything.

I'm even more clueless with the Munsters. It starts out with me being Lily and I can throw magic zaps at ghosts. I found Herman and Grampa in the basement, but they don't do anything. I tried every key on the keyboard, but I couldn't find any actions under them. What is the purpose of this game?

Well, Gods displays a smoother colour blend in the sky on an STE, and if I
recall correctly,
Chaos Engine (way overhyped in my opinion) had *slightly* smoother scrolling,
but alas, still
burdened with absolutely awful chip noise - no DMA sound anywhere... I bought
this game after
believing that it was _properly_ STE enhanced, having read the ST Format review
(yes, I am a mug,
reply with various insults). It even came with a damn cheeky scrap of paper that
said something
to the effect of, "Due to limitations of the ST hardware, there is no speech in
the ST versions."
Needless to say I was infuriated.

NOT.

See some other mails re. this. Hutch said s. th. and I posted a longer mail as
well.

>software that is written to take advantage of the DSP **can** compete with a
>486. Granted there isn't much (Apex Media being a very notable exception, but
>there are others) software that does use the DSP, but the capability is there

I mentioned the midi and music stuff, which make perfect use of the DSP. Even
in a professional environment.

IMHO, APEX is not for proffessional use, as it does not provide Anit-Aliasing.

> A fourth point -- since we're discussing MagiC here, tell me what on earth
>you're planning on running on a 486 that will touch MagiC for speed, when

There are loads of things one cannot achieve with an Atari. Network servers,
client server database applications. *Graphical* InterNet access, a la MOSAIC,
and so on.

>taken into account, my compute 4 megabyte Falcon is much faster than my
>roommate's 486 DX2-66 with 4 megabytes. Obviously that isn't a fair comparison

Everyone who is using a PeeCee with only 4 megs is an idiot (sorry). You have
the eassiest way of using at least 8 megs. And 1 meg simm's aren't that
expensive at all.

>>How much are you willing to pay for 68040 upgrade for a Falcon? Compare this
> Probably $200.00 Canadian. >:) I probably won't see it either though,

You won't even get a single 68040 for that amount ...

Message-ID: <01HMQ4UD87YQ8WWFVX@SNYONEVA.CC.ONEONTA.EDU>
Source record: 171960

That Toad Computers deal certainly sounds good - I have seen and/or played a number of those titles mentioned over the years and can attest that most are worth owning.

However, be aware that many of these games were written quite a few years ago (pre-1989) and are imported from Europe (always the traditional source of ST games).

Because of this - some might not work well with TOS versions above 1.4. It has long been the trend in the US to upgrade TOS to 2.06 or 1.4 and some of these game might not work because they were designed many years ago when TOS 1.0 was in vogue. Also, since the ST sold so many units in Europe, publishers seldom support newer machines because of the sheer number of TOS 1.0 and 1.2 users out there.

SO, the moral of the story is this: If you have an STe, Mega STe, or a Falcon you might want to ask the good people at Toad if any particular titles you are interested in will work on your respective machine.

I used to make programs with the Omikron language sometime ago with
my Atari ST and all was ok.
Now I have a Falcon and I am disappointed to see that they don't even
work compiled.

I used the Omikron 3.01 language with the Junior compiler.

Does a patch exist for the Falcon or does somebody know how to have
a version of the compiler running on the machine? please help|||

I had the same problem from here, but the site administrator has
closed all access from outside the uk. I attach danny's message
which he sent me when I asked about the problem:

Hi Ton

> When I am trying to access the Atari section on micros.hensa.ac.uk I now get
> a message that my client is not allowed to access the particular page.
> It used to be one of my favorite Atari pages and it is a pity that I cannot
> access it any more via WWW.

Thank you for the complement....

However, you are correct....you can not access the page anymore. :-(I
am really upset about this, as it was not my decision.....the load on
our system hit an average of 45 day before yesterday, and so the
systems manager totally restricted non ac.uk domain access.

I am hoping that this will not last for long, as the load on the system
hit that high yesterday too, which means that it not gopher or WWW.

I am upset too, as most Atari users that use the Atari section here are
from overseas....hardly anyone here in the uk, in education bothers
with Atari computers. :-(This could also lead to the closure of the
Atari section due to not much usage. :-(

I need cheering up. Hopefully, we will soon find what the cause is for
the high loads, and revert back to full unrestricted WWW access. In the
meantime, please use us via ftp.

Would you like to be on the mailing list for Atari newsletters?

> If it is intentional please make some info page available on the situation
> and post a message about it to the comp.sys.atari.st.* groups.

I will do that. Thanx for reminding me..

Do keep in touch. :-)

Regards
Danny

My info is that 14 MB is the max (some weird Atari architecture thing).
The simm pin size is the 30 pin flavor (4MB max on that I think).
And last but not leat I have an add on 3rd. party device called "RAM Gizmo".
I don't have the specs on me today but I'll check it out at home tonight.

I would certainly -hope- not! :) But I now understand that evidently
Insignia -did- in fact release the Atari version of SoftPC into the
public domain. Atari Corp wasn't very happy with this, for some reason,
but it seems that Insignia did it anyway, AFAIK.

Just wanted to correct myself. Sorry I can't answer your original
question about SoftPC with DOS 5.0, Richard.

I'm not exactly using it daily, but weekly yes. I am very impressed by it.
It's pretty fast (provided you have the HSMODEM serial patch), and using
TOSWIN or MIWM you can have multiple sessions open at once easily. I am
using a 14400 baud modem. I haven't used a TT or F030 (--> Deprived <--),
but it won't be any faster as the modem is the bottleneck.

1833. Possible to put 720k drive in SF 354 ?

Newsgroup: comp.sys.atari.st
Date: 1995-02-06 19:45:51 UTC
From: jwilhelm@Physik.TU-Muenchen.DE
Message-ID: <3h5u9f$dt0@sunserver.lrz-muenchen.de>
Source record: 171975

Hi,

I have an old single sided Atari SF 354 floppy drive and a spare 720k drive from a dead 1040STF. I replaced the single sided drive in the SF 354 with the 720k drive. Problem: it's working only as a single sided drive, I can neither read nor format 720k floppies. Is this a problem with the electronics found in the SF 354? Or might my drive be broken?

What's the purpose of the board in the SF 354 - it has a 40 pin chip labeled 8048 on it.

Any answers (preferably by mail) will be greatly appreciated.

Thanks, Jan

I think it was in ST Format (I KNOW) they had an article on the 040 a while
back and in that it said that they said that they were all clock doubled.
Besides which a DX266 is not twice as fast as a DX32 as the rest of the
machine slows the chip down - I don't think Intel increased the cache size
either.

1837. syslogd binary? (for MiNTNET PPP)

Hello,

I have gotten MintX to work well, I have got MinTNET installed, now I am trying to get a PPP connection going. The pppd docs say syslogd is needed to run it - so I got MinTOS 1.4.1 and proceded to just try and get syslogd (and some updated file utils) I do not want to set up with users like a BSD system. The problem is there is no binary in the distribution for syslogd, only source and I do not have gcc up and ready to go to compile. Is there any binary of syslogd floating aroiund the net? I've kept the syslogd.conf file from MintOS but I don't want to install all of MintOS

Thanks,
Sam

It's purpose is unknown to me at this time, it seems to buffer the data between the Atari and the physical drive. I did modify it to work with a double sided NEC drive. It is currently controlling a 5.25 DSDD drive on my TT.

The change is not to hard to figure out if you have the descriptions of the 34-pin floppy contector, the 14 pin Atari connector, and a TTL-Logic handbook. Draw the logic diagram that controls the head select and the device select lines, the changes should be fairly obvious.

I can open up my case if you really need me to, but I would prefer not to.

Hello,

I've decided to sell my STacy 4 because I just don't use it enough.

STacy 4
4 MEG RAM
52 MEG internal hard drive
720 3 1/2" floppy
External Power Supply
Corduroy/nylon carrying case with handle and shoulder strap
Has standard ST ports. MIDI, Paralell, Serial, Mouse, Joystick, DMA, Monitor
Has built in track ball, but if you wish you can use a mouse
Has built in backlit LCD 640x400 mono screen.
You can hook up either an external color or mono monitor.

Unit is in great condition and works fine. Asking $900 or best offer.

E-mail me or call 216-729-0761 evenings 6:00 - 10:00 PM EST

Just make sure that the SSCI ID is set to a different (prferably higher)
number than your first drive. Depending on your host adaptor you might also
have to worry about parity, and in all cases keep an eye on SCSI
termination - though you might well get the drive working without actually
getting this right.

> Do I have to reformat and partition my existing drive too, or will

No.

This is what I've been trying to do - though I'm more interested in getting
MiNT-Net/NFS to talk to NFS on a PC running Linux. So far I have the PC
mounting the Atari drives but not the other way around. Anybody had any
success here?

Thanks

Roland.

Actually what you say isn't quite true either. ;-)

An Atari SC1435 is a genuine Atari monitor which is analogue RGB. But if
you use it with a CGA cable on a PC then it will work as a CGA monitor
(according to the manual anyway).

I suppose its worth noting though that not all Atari monitors can be used
in this way though.

:-)

> Q. 2d. How do I use it?

Something along the lines of:

MINIT -P -V G:

Though try it on the A: drive first! I'm not sure if the -P and -V are case
sensitive.

> Q. 3. Do I need (or have any advantage) in getting lynx?

Well its a text WWW browser - do you need it?

> ? "Wouldn't it be nice if at least one person actually sat down and

> and who know's the e-mail adress of the makers ?

I've had it running on a TT 4+4 no problem. Should work in 4Mbs no problem.

The main problem is finding DOS 5 install disks on 720K format as SoftPC
can only cope with 720K disks even if you have a 1.44Mb drive.

I picked up a new copy of Elonex DOS 5 on 720Ks for 5ukp.

:-)

>
> I presume Linux has a WWW browser available for it?

Yes, it has. If you don`t mind text-only applications you can run
Lynx, which is also available for MiNT+MiNTNet. If you install X11R6
on your Linux-box you will also be able to run graphical web-browsers
written for X. I don`t know if Mosaic has been "ported" yet, but I
guess it shouldn`t be too hard since Linux68k+X11R6 makes a very nice
platform.

> Also what is the minimum set up I would need. At present I have
> a 4mb F030, FPU and 65mb HD.

To run X11R6 at a decent speed you will probably want more RAM and
possibly a 32MHz-accelerator. And you will definately want more HD-
space. I suggest you get at least 0.5GB since prices have dropped quite
a lot the last year. However, if you`re short on money (hey, aren`t
we all?) and find a second-hand 100-megger at a real bargain then it
might be enough for a couple of months. But as always, YMMW!

AFAIK you could get a very nice Linux-system including X11R6 running
on a 40MB partition, but you will not have much room to play with.
